REPORT

TO

The Right Honourable HENRY AUSTIN BRUCE, M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
31st March 1870.

SIR,

I HAVE the honour to submit to you my Annual Report for the year 1868.

The population is estimated at 21,649,377 in the middle of the year 1868, being an increase of 219,869 over that of the previous year; 10,456,743 of the total number living are males and 11,192,634 are females.

The natural increase of population as represented by the excess of births over deaths was 306,236 or 839 per day, a number much above

1868	21,649,377	176,962	353,924	786,858	480,622	306,236

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

the average. 196,325 emigrants left the shores of the United Kingdom at the rate of 538 daily; of these 60,265 were of English origin, 15,395 of Scotch, 67,075 of Irish; 53,590 were foreigners: 6,182 persons whose birth-places were not distinguished are proportionally distributed in this statement.

The United States attracted 155,532 of the emigrants, while 21,062 went to the British North American colonies, the unusually small number of 12,809 to the Australian colonies, and 6,922 to various other places. The total emigration was 372 in excess of that in 1867, but shows a large reduction on the numbers emigrating in the four preceding years 1863–6. Details showing the occupations, sex, and ages of the emigrants are given in tables at pages lxx–lxxii.

Emigration to North America is promoted by the sums annually remitted by settlers, either in the form of prepaid passage orders or in cash, to their friends in the United Kingdom. In the year 1868 the amount thus remitted was at the least 530,564*l.*, for this return is necessarily imperfect, and was obtained by the Emigration Commissioners through the courtesy of bankers, merchants, and shipowners, through whom the remittances are made.

The number of persons married in England and Wales was 353,924; 786,858 children were born alive and registered; 480,622 persons died during the year; and the national registers have thus received an addition of one million six hundred and twenty-one thousand four hundred and four names, raising the aggregate number since the commencement of civil registration in 1837 to *forty-two millions and fifty-two thousand eight hundred and eighty-six.*

The meteorology of the year presents some remarkable features which are described in the summary of the quarterly reports, pp. xlv–lix;* the mean temperature of the air at the Royal Observatory, Greenwich, was

NOTE.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, persons married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results; no correction, however, has been made for leap years.

* See also Remarks on the Meteorology of 1868 by James Glaisher, Esq., F.R.S., &c., pp. lx–lxiii.

51°·5, or 2°·3 above the average; 25·2 inches of rain fell, being 1·0 inch above the average.

The price of wheat continued high; it averaged 72*s.* 2*d.* per quarter in the first three months, 71*s.* 10*d.* in the next three months, 59*s.* 1*d.* in the

* In the case of mixed marriages between Protestants and Roman Catholics some couples are married twice, and are counted twice in the Registers.

three following months, and 51*s.* 11*d.* in the last quarter, the average price during the year being 63*s.* 9*d.* per quarter, compared with 64*s.* 5*d.* during the previous year. The wholesale price of potatoes which was 89*s.* per ton in 1866 rose to 138*s.* per ton in 1867, and 137*s.* 6*d.* per ton in 1868. The returns of pauperism show a considerable increase, and the average numbers on the last day of each week amounted to 148,511 in-door and 809,336 out-door recipients of relief against 139,565 in-door and 782,390 out-door poor in the previous year.

Marriages.

353,924 persons married during the year 1868, a number less by 4384 than in the previous year, and 21,628 below that in 1866. As the fluctuations in the marriages express pretty accurately the condition and prospects of the people, it may be inferred from these numbers that the commercial depression of the country has not been dispelled. The circumstances which have caused so remarkable a decrease, and which are traceable to the prostration of trade and national industry, began in 1866–7, and, notwithstanding the bountiful yield of the wheat harvest of 1868, continued throughout the year. Money was cheap during the first three quarters of the year, the average minimum rate per cent. of discount charged by the Bank of England being 2 per cent.; but commerce and manufactures were in a state of stagnation. The marriage-rate (persons married to 1000 of population) for the year 1868, when the average price of wheat was 63*s.* 9*d.* per quarter, was 16·34, against an average for the last 31 years of 16·52. In 1866, when the price of wheat was as low as 49*s.* 11*d.* per quarter, the rate rose to 17·70 per 1000.

Of the 176,962 marriages, the numbers solemnized according to the rites of the Established Church were 136,038, or 77 per cent.; the numbers performed not according to the rites of the Establishment were 40,924, or 23 per cent. The proportions are nearly as 10 to 3. Of 100 couples who married in 1868 according to the rites of the Church, ·02 were married by special licence, 13·4 by licence, 81·5 after banns, and

Note.—The Table may be read thus:—To 1,000 unmarried men living in England and Wales at the age 25 and under 30 years, 145·86 married in the year 1868; and to 1,000 unmarried women living at the same age—25 and under 30 years—97·69 married in the year 1868, and so on for other ages. The persons marrying without stating their ages have been distributed proportionally over all the ages in the Table.

3·0 by Superintendent Registrar's certificate, while in 2·1 instances it was omitted to be stated under which of the foregoing heads the marriages should be classed. Of 100 couples who married not according to the rites of the Church 18·4 were Roman Catholics, 41·9 were members of various Christian denominations, 0·2 were Quakers, 0·7 were Jews, and 38·8 were married at Superintendent Registrars' offices.

The Quakers married in larger numbers than usual, their marriages in the last four years were 54, 63, 68, and 73 respectively.

The marriages among Jews decreased in England and Wales; the numbers in the registers of the last four years were 353, 301, 315, and 306.

Of the 176,962 marriages solemnized in 1868, 144,578 were between bachelors and spinsters, 7521 were between bachelors and widows, 15,762 were between widowers and spinsters, and 9,101 were between widowers and widows.

There were 40 marriages in the year 1868 in which one or other of the contracting parties is stated to have been previously divorced.* The registers of marriage show that 16 divorced men married spinsters, 2 divorced men married widows, 17 bachelors and 4 widowers married divorced women, and 1 divorced man married a divorced woman.

Buildings registered for Marriages.—The number of these buildings on the register at the end of the year 1868 was 5992; 1763 of these belonged to the Independents; 1219 to the Baptists; 1490 to the various sects of Wesleyan Methodists; 313 to the Calvinistic Methodists; 156 to the Unitarians; 180 to the Presbyterians; and 651 to the Roman Catholics. The United Brethren or Moravians have 15 buildings registered for their marriages, the New Jerusalem Church has 26, and the Catholic and Apostolic Church has 19. The number of places of meeting certified for public worship on the register on 31st December 1868, including the

	XI.—MONMOUTHSHIRE AND WALES.							
42	Monmouthshire	15·02	65·1	57·9	7·64	24·72	14·17	11·59
43	South Wales	15·34	69·9	53·2	7·62	18·61	13·81	9·36
44	North Wales	13·26	68·5	56·2	4·05	12·43	15·28	9·34

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 person living 1,634 persons were married; of 1,000 men married 799, of 1,000 women 722, signed the marriage register by writing their names; of 10,000 men married 715 were not of full age, of 10,000 women married 2105 were not of full age; of 10,000 men married 1405 were Widowers, of the same number of women married 939 were Widows.

married in 1868 was 42·4 years, while the mean age of the widows was 39·2 years.

Marriages of Minors.—12,658 men and 37,245 women married under 21 years of age, so that of 100 men who married, 7·15, and of 100 women who married, 21·05 were under age. The marriages of minors have been increasing for many years. The proportion of young women under age was 17·1 in 100 for the ten years 1849–58, while it was 19·9 in 100 for the ten years 1859–68. The proportion of men under age increased in the same years, but not to the same extent; in the first decade the ratio was 5·4 per cent.; in the second decade it was 6·6 per cent.; but the age at marriage depends very much upon the age at which the parties attain what they consider a fair income to enable them to maintain a family. In order to determine the counties in which the proportion of early marriages is greatest, it would be necessary first to ascertain the proportion which the population under age bears to the persons living at all ages. The counties which supplied the greatest proportion of females who married under 21 years of age in 1868 are Durham, 32 per cent.; Stafford, 30; Bedford, 27; West Riding of York, 26; Leicester, 26; and Northampton, 26 per cent.

Ages of Persons married.—Of 176,962 marriages in the year 1868 the precise ages of both parties were specified in 118,634 instances. In every 100 marriages the ages were omitted to be recorded in 33 cases; the cause of this regrettable defect was explained in my last annual report (page v). Great disparities of age in the persons who married are observable in the returns, among which may be mentioned that of a bachelor aged 21 married to a spinster aged 50-55; also three cases in which men aged 80 and under 85 were united to brides of the respective ages of 30–35, 35–40, and 40–45.

The mean age of the persons who married in 1868, including those who re-married, was 27·9 years for the men and 25·7 years for the women. Excluding the widowers and widows the mean age of those contracting marriage for the first time was 25·8 years for the bachelors and 24·4 for the spinsters who married in the year.

Signature of Marriage Registers.—35,628 men and 49,244 women made marks in signing the marriage register in the year 1868. Of 100 men married 80 wrote their names and 20 made marks. In 100 women married 72 wrote their names and 28 made marks. The returns afford clear proofs of a slow improvement in the elementary education of the people; in the year under review, out of every 100 marriages 17 persons were able to write their names in excess of the number in 1841, 27 years previously.

The details showing the proportion of men and women in different parts of the country who did not write their names in the marriage register may assist in determining the localities where educational effort should be more particularly directed, for although the signature may not be an absolute test of the state of elementary education in England, it is nevertheless an excellent statistical measure of the degree of education in the different counties. Thus in some parts of England and Wales only about one half of the women who married were able to sign their names in writing; viz., in South Wales, where the proportion per cent. was 53·2; North Wales, 56·2; Stafford, 57·6; Monmouth, 57·9; and Lancashire, 58·1. The proportions were also low in the West Riding of York, 63·3; Bedford, 63·6; Durham, 65·5; Cheshire, 67·2; Cornwall, 67·3; and Nottingham, 68·8. Among men the per-centages who wrote their names were lowest in the counties of Monmouth, 65·1; Suffolk, 66·1; Stafford, 66·5; Bedford, 67·8; North Wales, 68·5; Norfolk, 69·2; Hereford, 69·8; South Wales, 69·9.

The counties and extra-metropolitan parts of counties, &c. in which the highest proportions of women who wrote their names are found are Surrey, 88·1; Middlesex, 88·0; Rutland, 87·3; Westmorland, 87·2; Sussex, 86·6; London, 85·8; Hants, 84·6; Kent, 83·0; and Oxford, 82·1. Among men the per-centages were highest in London, 90·9; Westmorland, 88·7; Middlesex (extra-metropolitan), 86·6; Rutland, 86·1; and Northumberland, 85·4. The degree of elementary education differs in every county; but these results prove that the uneducated are to be found in greater numbers among mining and manufacturing populations than in the agricultural portions of the community.

Any signs of progress in the education of the people of this country are encouraging, but a comparison of the English marriage registers with those of Scotland shows that there is room in England and Wales for great improvement. In 1867, the most recent year for which the Scotch returns are published, the results show that 89·4 per cent. of the men, and 79·3 per cent. of the women, wrote their names in the marriage register, leaving the relatively smaller, but still regrettable, proportion of 10·6 per cent. of men and 20·7 per cent. of women who were unable to write. In England in the same year the proportions who were unable to affix their names to the register were 20·1 per cent. for men and 27·8 per cent. for women! The counties in Scotland where educational efforts claim most attention are Ross and Cromarty, Inverness, and Sutherland; the proportion per cent. of men in these counties who were able to write their names was 60·6, 71·5, and 78·9 respectively; while among women the proportion was 45·8, 53·5, and 68·4 respectively. In the county of Kinross all the men and women who married in 1867 were able to write their names, and in the county of Selkirk all the men and 98 per cent. of the women wrote their names. For a sketch of the progress of the people in the art of writing *see* pp. xxxvi–xliv.

Births.

The births of 786,858 children born alive were registered in 1868, being an increase of 18,509 over the number in the previous year. The annual birth-rate per 1000 of population is the highest recorded in the English returns, and affords a ratio of 36·35, against an average in the thirty-one years 1838–68 of 33·73.

The highest birth-rates are recorded in the counties of Durham, 42·90 per 1000; West Riding of York, 40·53; Leicester, 39·97; Lancashire, 39·24; Stafford, 38·57; Northumberland, 38·27; Bedford, 37·71; Monmouthshire, 37·62; and Cheshire, 37·27. The lowest are recorded in Rutland, 29·07; Hereford, 29·28; Westmorland, 30·48; Cornwall, 31·25; Dorset, 31·66; Somerset, 31·68; and Devon, 31·90. Taking an average of years, Durham is conspicuous as having the highest birth-rate, and next in order is Stafford. In counties containing the great manufacturing districts, especially the coal and iron industries, the men are greatly in excess of the women, but the true cause of the high birth-rate prevailing in these two counties is to be found in the excessively high proportion of married women at the child-bearing ages. Thus the Census returns of 1861 show that in England to every 100 women living at the ages 15–45 there were 49·1 married. In the county of Devon the proportion was 45·4 per cent., while in the counties of Durham and Stafford the proportions per cent. were 57·3 and 57·0 respectively. The birth-rate in the mineral and manufacturing counties is generally high, while in the agricultural districts the reverse obtains. If the ratio of legitimate births to married women be compared, and also the ratio of illegitimate births to spinsters and widows, the results are strikingly confirmatory of the above statement. Thus in the seven years 1858–64 the average annual number of legitimate births to every 100 married women of the ages 15 and under 45 in the counties of Durham and Stafford was 33·6 and 32·5 respectively, while in the agricultural county of Devon the proportion was only 29·5; in England the rate per cent. was 28·3. The average annual number of illegitimate births in the seven years to every 100 spinsters and widows of the ages 15 and under 45 was 2·4 in Durham and 2·6 in Stafford, while in Devon the proportion was only 1·4; in England the ratio was 1·9 per cent.

Sex.—Of the 786,858 children born 400,383 were boys and 386,475 were girls, so to every 100 girls 103·6 boys were born. The proportions differ in the several counties. Thus, in Huntingdon, and in Surrey (extra-metropolitan) the boys were less in number than the girls, the proportion of males born to every 100 females born being 94·3 and 99·7 respectively; in two counties, viz, Hampshire and Berkshire, the proportions were nearly equal. The counties in which the greatest disparity in sex is

24·10 in the fourth quarter. In the year 1868 the numbers registered in each quarter were 198,584, 202,839, 192,583, and 192,852 respectively. The relative birth-rates in the seasons of 1868, taking 1000 births as the standard, were 1015 and 1036 in the winter and spring quarters, and 974 and 975 in the summer and autumn quarters.

Children born out of Wedlock.—The true number of children born out of wedlock is unknown. Of the total children born in England in the year 1868, 46,338, or 5·9 per cent., were registered as illegitimate. In the six years 1851–56 the number of children thus born to every 1000 births

illegitimacy therefore in this country is declining. In some countries the ratio is considerably higher than in England, but many circumstances have to be taken into consideration in making any comparisons in this direction. In France the rates are comparatively low. In Austria the rate is high, while in Würtemburg and Bavaria it is excessively high. In some of the European States marriage is prohibited until the parties can show that they have the means of maintaining their offspring, and concubinage is often the result. The proportions in Table 10 apparently indicate that the rate of illegitimacy is not generally great in the English counties containing the large manufacturing centres of industry, but this may, to some extent, be due to omissions of illegitimate births. In the North Riding of York and in Nottingham the rates are high, the proportions per cent. being 8·8 and 8·0 respectively. The highest rates are observed as usual in the counties of Cumberland, 10·7; Westmorland, 10·0; Norfolk, 9·9; and Salop, 9·6. The lowest rates are in the following counties and extra-metropolitan parts of counties, &c.; Middlesex, 3·7 per cent.; Surrey, 4·1; London, 4·2; Kent, 4·7; Monmouth, 4·8; Rutland, 4·8; Hampshire, 4·9; and Essex, 5·0. A truer method of measuring the degrees of immorality existing in the different counties consists in a comparison of the illegitimate births with the number of unmarried women at childbearing ages; a test which can only be made by means of the results of the enumeration of the number of spinsters and widows living at different ages obtained at the census.

A remarkable instance of early fecundity occurred at Rochford in Essex. The daughter of an agricultural labourer gave birth to a boy before she

Average of 31 years, 1838–68	23·34	21·49	104	108

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·42 deaths of males; to every 1000 females living there were 21·46 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

had attained the age of 11 years. It is satisfactory to know that the father of the child was prosecuted and sentenced to imprisonment.

Deaths.

480,622 deaths were registered in England in the year 1868, or more by 9,549 than in the previous year; but as the population has grown proportionally greater, being now estimated at 21,649,377, or 219,869 in

excess of the previous year, the rate of mortality was but slightly in excess of the remarkably low rate observed in 1867. Thus the death-rate per 1,000 of population in 1868 was 22·20 while in 1867 it was 21·98. In the 31 years 1838–68 the average annual rate was 22·40 per 1000.

The history of health and disease has now been recorded in England for thirty-one years, and the rates of mortality experienced during this lengthened period have been successively reviewed year by year, as have also the fluctuations in the causes of death. It is to be regretted that much of our knowledge of the laws of sickness and of health has only been acquired at the price of dearly bought experience; one advantage, however, that has accrued from noting the rise and fall of epidemic diseases, together with the circumstances which produce and foster them, is that no great outbreak of disease has been allowed to pass away without giving a new impulse to sanitary measures.

The grand end that has ever been kept in view in digesting these facts has been to discover the relation which certain results bear to causes under control, for this, after all, is the great lesson to be derived from such statistics. The prevailing epidemics of the year 1868 were diarrhœa

and scarlet fever, diseases which have never ceased to carry off a large though varying number of victims. It is to be hoped that the retribution which follows the violation of sanitary laws will be as reformatory in its action with reference to this latter highly contagious disease as it was in the recent visitations of cholera. It is still as necessary as it ever was to urge the adoption of sanitary arrangements, so that epidemic diseases like scarlet fever may no longer be diffused by the effluvia of cesspools and open drains, by impure air, by overcrowded dwellings, and by unwholesome water.

The returns of recent years afford proofs that some diseases have been brought under control, and it is encouraging to reflect that any sanitary measures adopted to check the ravages of any one epidemic are operating at the same time more or less towards the reduction of the virulence of others.

The Seasons.—The principal meteorological characteristics of the year 1868 were excessive heat in summer and a long continuance of high temperature. In the first three months the mean temperature of the air at Greenwich was 41°·4, or 1°·6 above the average; and the rain-fall measured 6·6 inches, or 1·6 inches above the average. The weather was

apparently favourable to the public health, the mortality of the quarter being at the annual rate of 22·26 per 1,000 of population, or 2·76 per 1000 below the average. In the second quarter of the year the mortality was at the rate of 20·41 per 1000, or 1·78 per 1000 below the average; the mean temperature of the season was 55°·8, or 3°·0 above the average; and the rain-fall measured 4·3 inches, or 1·6 inches in defect. In the third quarter the extraordinary high temperature, combined with a great defect in the amount of rain which fell, greatly affected the public health; the rain-fall was deficient to the amount of 2·5 inches, only 5·1 inches fell instead of 7·6 inches, while the mean temperature was 63°·9, or 3°·6 in excess of the average. The mortality of the quarter was 23·88 per 1000, or 3·27 per 1000 above the average. In the last quarter of the year the death-rate was near the average, 21·99 per 1000; the mean temperature was 45°·1, or 0°·5 above the average, and the rain-fall measured 9·2 inches, or 2·1 inches in excess. Out of 100 deaths in the year the proportional number registered in each quarter was 24·90, 22·89, 27·15, and 25·06 respectively, while the average proportional number for each quarter during a period of 31 years was 27·49, 24·62, 23·24, and 24·65. If 1000 deaths are taken to represent the number in an average quarter, then the deaths in each quarter will be represented by the following proportions, 1001, 921, 1081, and 997 respectively.

Sex.—Of the 480,622 deaths registered in 1868, 247,107, or 51·4 per cent., were those of males, and 233,515, or 48·6 per cent., were those of females. In other words the deaths of males were to the deaths of females as 106 to 100.

Owing chiefly to the excess of emigration of males over females, the female population exceeds the male; but of equal numbers living the number of male deaths to every 100 deaths of females was 113. On an average of 31 years the proportion was 108. The number of deaths to

* For mode of reading this Table, see Note to Table 20.

NOTE.—The Population used in the above calculations is now deduced from the ascertained rate of increase observed in the 20 Years 1841-61.

1000 living in the year 1868 was 23·63 among males, while it was only 20·86 among females; but a higher rate of mortality among males is a result which indicates nothing unusual, as the average proportions observed during 31 years were 23·34 and 21·49 per 1000 respectively; females suffering less than males in England from insalubrious and other unfavourable influences.

Locality.—The mortality in 1868 was above their own average of ten years in the following counties or extra-metropolitan parts of counties, &c.: Surrey, Bedford, Leicester, Cheshire, Lancashire, West Riding and East Riding of York, Durham, Northumberland, Cumberland, and North Wales. In the remaining counties the mortality was below their own average. The annual rate of mortality to 1000 living in 1868 was highest in

The Table may be read thus:—Of 1000 males living of the age 35 and under 45, 13·58 died in 1838, 12·65 in 1839, and 11·62 in 1850; the average annual rate in the 30 years, 1838-67, among the aggregate of males in this decennial period of age was 13·03.

† A period of seven years has elapsed since the ages of the people were ascertained at the Census. There are no means, therefore, of determining, with any degree of accuracy, the relation which the deaths now bear to the population at the several ages in the above Table. Under these circumstances it has been considered expedient to discontinue publishing the rates of mortality at the different ages, until the results of the enumeration of 1871 are ascertained. The rates of mortality at each age for the year 1868 are therefore omitted in Tables 20 and 22. The *deaths registered* at the several ages are given in Tables 17 and 18.

Lancashire, the county containing the great seat of the cotton manufacture, viz., 27·11. In the West Riding of York, containing the large towns of Sheffield, Leeds, and Bradford, the death-rate was 25·74; in Leicestershire it was 24·96; in Durham, where the mortality is usually high, it was 24·75; in the East Riding of York the rate was 23·85 per 1000. In Northumberland and Cumberland the mortality has been gradually increasing; eleven years ago it was 21·89 and 20·64 per 1000 respectively, while in 1868 it had increased to 23·85 and 23·34. In London the annual mortality was 23·60; in Chester 23·53; then follow Warwick, with a mortality of 22·22 per 1000; North Wales, 21·02; and Stafford, 21·78. Even in the counties of England and Wales, where the lowest death-rates are observed, the sanitary condition of the people is still in many respects defective. In some of these counties and extra-metropolitan parts of counties the mortality was unusually low in 1868. Thus the death-rate per 1000 of population was less than 17 in Westmorland; less than 18 in Dorset, Rutland, Kent, and Hereford; and less than 19 in Somerset, Oxford, Wilts, Surrey, Suffolk, Devon, Lincoln, Sussex, Essex, Cornwall, Salop, and South Wales. It must be borne in mind, however, that in thus reviewing the general mortality, various elements have to be taken into consideration, such as occupations and age; the mortality at all ages depends greatly upon the relative death-rates among children under five years of age in each county. The above results indicate that the highest rates occur in the counties where the great manufacturing and mining industries of the country are carried on.

In the year 1868, 928 lives were returned to the Inspectors as lost by accidents in and about the 2,776 collieries of England and Wales.* 237 of these occurred in the fields of South-west Lancashire and North Wales. The inspector of this district, in his report for the year 1868, states that a great number of men are employed in the mines who are ignorant of their business, and who, if not actually reckless, are negligent and unthoughtful; the majority of the men can neither read nor write, and many of the casualties can be traced to incapacity and neglect arising from

* These returns are incomplete, see causes of violent deaths, p. 174. The total number of deaths in 1868 by violence in the mines of England and Wales was 1215, viz., 1117 connected with coal mines, and 98 connected with other mines.

intemperance. A great number of excellent schools have been established in the district for boys, but a more competent class of men are required to act as overlookers and firemen; good firemen are scarce, and, it appears, will continue to be so until some arrangements are made to educate and train them for the discharge of their important duties. At present no such provisions exist in the South-west Lancashire and North Wales district. The inspector further states that "the work-people are rough, and in many "instances disobedient; they do not properly observe the provisions of "the special rules. They neglect to prop and spray the roof and sides "of the mine. They descend and ascend the pit contrary to published "instructions. They discharge shots defectively, which frequently blow "out in a vitiated atmosphere, and cause an explosion. . . . . They "open or interfere with their safety-lamps, so as to enable them to "smoke below ground, which is strictly prohibited. . . . . It is "seldom, however, that accidents have been caused by old and expe-"rienced colliers or mining men, but chiefly by strangers to the mine, "or those who began late in life to follow the employment, or by the "young and inexperienced."

The reports received from the inspectors of the different coal-fields of the country are all more or less confirmatory of the above statement, viz.: that much of the lamentable loss of life in collieries may be traced to the

employment of unskilled officials and untrained workmen. The importance of the question, as to whether the loss of life by explosions of fire-damp and by other accidents can be prevented by the education and training of the miner, demands the serious attention of the colliery proprietors. The notice of the Legislature is already drawn to the subject, and it is to be hoped that the Bill to consolidate and amend the Acts relating to the regulation and inspection of mines, now before Parliament, will tend greatly to reduce the number of casualties and the serious loss of life among the operatives of our collieries. Mr. Robert Hunt, the keeper of mining records, has recently stated that an association in Cornwall and Devonshire has successfully carried on the work of educating the working miners in those branches of knowledge which have a direct bearing on practical mining. He attributes the success of the association to the system of taking the school to the miner, instead of requiring the working miner to come to the school.

Towns.—A comparison of the death-rates of eleven great English towns shows that Manchester had the highest mortality in 1868, and Bristol the lowest. The Metropolis enjoyed a favourable position on the scale. While the mean death-rates to 1000 persons living in the eleven towns in each of the years 1867 and 1868 were nearly the same, viz., 26·49 and 26·62 respectively, they were 23·08 and 22·79 in Bristol, 22·98 and 23·59 in London, 24·27 and 23·89 in Birmingham, 24·96 and 24·41 in Hull, 30·79 and 25·57 in Newcastle-on-Tyne, 24·17 and 26·49 in Bradford, 24·67 and 26·59 in Sheffield, 26·96 and 27·52 in Leeds, 29·57 and 29·22 in Liverpool, 28·50 and 30·76 in Salford, and 31·40 and 32·00 in Manchester.

Death-rates at different ages.—So long a period has now elapsed since the population living at different ages was enumerated, that any reasoning on the ratio which the deaths bear to the numbers living at the respective ages must be made with caution. It may be observed, however, that the exceptional character of the meteorological results of the year are

most strikingly reflected in the death-rate of children. A comparison of the mortality of males in 1868 with that of the previous year, when no such unusual climatic conditions prevailed, exhibits an increase at each quinquennium under 15 years of age, while the rate was in defect of the previous year at ages 15–25 and following decennia. Among females the excess in the mortality of children at the same ages is still more remarkable, while in all the successive stages of life above 15 years of age the rate of mortality in 1868 was below that of the previous year.

These results show that children under 15 years of age were the chief sufferers from the unhealthy influences of the year, but still not to so great an extent as to bring the mortality above the average rates observed in 31 years.

Among males the period of age at which the greatest excess is observed in the death-rate of the whole of England, as compared with the healthy districts, is—under 5 years. The mortality per 1000 living at this period was 71·36 in 1868, while in the healthy districts of England it was only 43·48. Among girls under 5 years of age the rate per 1000 in 1868 was 62·46, while the healthy district rate was 37·20 per 1000 living.

Children then, were the chief sufferers from the insalubrity which prevailed in 1868; and to discover the means whereby the heavy annual tribute of infant life can be reduced from 203,129—the number who died in England in 1868—to the number that would have died at the healthy district rate, viz., 122,524, and thus effect a saving of 80,605 or more lives, is one of the great sanitary *desiderata* of the age. Our knowledge in this direction can only be acquired by instalments, but it is to be hoped that the practical inquiries of sanitary science will tend towards the

Mean Annual Rate per 1000 in each Quarter –					25·02	22·19	20·61	21·81

* These rates may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

solution of the problem—how to reduce the death-rate of children under 5 years of age in the large town populations of England?

Of the 247,107 deaths of males *registered* in 1868, 108,325, or 43·84 per cent. occurred at ages under 5 years. At ages 5–10 the proportion was 4·10 per cent., and at 10–15 it was 1·98 per cent., so that to every 100 deaths of males at all ages 50 per cent. occurred at ages under 15 years. Among females the proportional number was rather less. Thus of the 233,515 deaths at all ages in 1868, 94,804, or 40·60 per cent., were those of children under 5 years of age. At ages 5–10 the proportion was 4·12 per cent., and at 10–15 it was 2·06 per cent. The ratio at ages under 15 years was 47 per cent.

Further details relating to the marriages, births, and deaths in the year 1868, with remarks on the sanitary condition of districts, and other matters, will be found in the reports which were published within a month after the expiration of each quarter. (See pp. xlv.–lix.)

The United Kingdom.

The population of the United Kingdom at the middle of the year 1868 is estimated at 30,380,787. After correction for defective registration in Ireland, the number of persons married in the year was 488,252, the number of births was 1,104,026, and the number of deaths was 673,070. The natural increase of population by the excess of births over deaths was 430,956. After deducting 142,735 emigrants of home origin, this number is reduced to 288,221.

Table 25.—Estimated **Population, Marriages, Births,** and **Deaths** in the **United Kingdom,** in the Year **1868.**

	Area in Statute Acres.	Area in Hectares.	Estimated Population in the middle of the Year 1868.	Marriages.	Persons Married.	Births.	Deaths.
United Kingdom	77,286,901	31,275,782	30,380,787	244,126	488,252	1,104,006	673,070
Great Britain – –	56,964,260	23,051,796	24,837,502	198,815	397,630	902,531	550,008
England and Wales –	37,324,883	15,104,307	21,649,377	176,962	353,924	786,858	480,622
Scotland – – –	19,639,377	7,947,489	3,188,125	21,853	43,706	115,673	69,386
Ireland – – –	20,322,641	8,223,986	5,543,285	? 45,311	? 90,622	? 201,475	? 123,062

Note.—The *registered* Marriages, Births, and Deaths for Ireland were 27,753, 146,108, and 86,303 respectively. By the authority of the Registrar-General of Ireland these numbers have been corrected in the above table for defective registration. It has been assumed that the marriages, births, and deaths in Ireland in the year 1868 were in the same proportion to population as the marriages, births, and deaths in England.

Table 26.—**Proportion** per **1000** of **Marriages, Births,** and **Deaths** to the Population of the **United Kingdom,** in the Year **1868.**

	Acres to a Person.	Hectares to a Person.	To 1000 Persons living.			
			Marriages.	Persons Married.	Births.	Deaths.
United Kingdom – –	2·54	1·029	8·04	16·08	36·34	22·15
Great Britain – – –	2·29	·928	8·00	16·00	36·34	22·14
England and Wales – –	1·72	·698	8·17	16·34	36·35	22·20
Scotland – – – – –	6·16	2·493	6·85	13·70	36·28	21·76
Ireland – – – –	3·67	1·484	? 8·17	? 16·34	? 36·35	? 22·20

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

The marriage-rate for the United Kingdom in the year 1868 was 16·08, the birth-rate was 36·34, and the death-rate was 22·15, per 1000 of population.

The marriage-rate in England is higher than that of Scotland; the respective rates of the two divisions per 1000 in 1868 were 16·34 and 13·70.

The English birth-rate was 36·35 per 1000 of population, the Scottish 36·28; and the respective death-rates were 22·20 and 21·76 per 1000.

The rates of marriage, birth, and death in Ireland were probably but little different from those in England.

Foreign States.

In France, out of an estimated population in 1868 of 38,342,818, the number of persons who married in that year was 301,197 or 1,676 more than in the previous year. The marriage-rate in 1868 (persons married to 1,000 of population) was 15·72 against 16·34 in England.

The number of births registered in France, exclusive of still born, was 984,020, the number in the previous year was 1,002,621. The

Note.—The above numbers have been compiled from returns furnished to the Registrar-General by Lieutenant-Colonel J. F. Murray, Government Secretary of Jersey, Lieutenant-Colonel W. Bell, Government Secretary of Guernsey, &c., and by Mr. S. Harris, Registrar-General of the Isle of Man. The returns for Guernsey and adjacent islands are imperfect owing to certain denominations neglecting to register the births and deaths.

* The increase in the number of deaths in each of the years 1864–66 is attributable to the prevalence of fever and small-pox. The Island is visited by a considerable number of persons, and it is estimated that on 1st August 1867 there were 64,000 persons on it.

† The decrease of population in 1867 is confined to Alderney, and is attributed to the discharge of men from the Government works.

French and English birth-rates per 1000 of population were 25·66, and 36·35 respectively.

The population of France increases less rapidly than that of England; a result attributable to several causes. The proportion of children to a marriage, and consequently the population of a country, are regulated to a considerable extent by the age at which marriage is contracted. This latter element, however, does not materially affect the increase of population in France, where the mean age of marriage is 30·1 years for males and 25·8 years for females; in England, as previously stated, it is 27·9 years and 25·7 years respectively, so that while the men in France marry 2·2 years later than in England, marriage among women is not postponed much longer in France than in England.

The difference in the fecundity of the two countries is remarkable. The relative proportion of registered births to a marriage in the year 1868, was 4·4 in England, while in France it was only 3·3. Ten marriages produce 44 children in England and only 33 in France.

The death-rates of the two countries do not differ greatly. In 1868, the mortality per 1000 of population was 23·96 in France, and 22·20 in England. In the 16 years 1853–68, the average annual rate was 23·72 in the former, and 22·45 in the latter.

In Austria the marriage-rate, on an average of 16 years, 1853–68, was about the same as that in England, but higher than the rate in France. In 1868 the number of persons married in Austria per 1000 of population was 18·52, against 17·82 in the previous year.

The Austrian birth and death rates were 39·30 and 29·34 respectively; they are both considerably higher than the English rates.

Italy with an estimated population of 25,527,915 shows a marriage-rate in 1868 of 14·32; a birth-rate of 35·27; and a death-rate of 30·45.

* M. LEGOYT, director of the Statistical Department of France, has favoured the Registrar General with the returns of France for the years 1853–61 and for the year 1866. The population in the four years 1862–65, and in the years 1867–68 has been estimated by means of the average annual rate observed between the two enumerations of 1861 and 1866.

† Including the three last annexed departments, viz., Savoie, Savoie (Haute), and Alpes-Maritimes.

‡ DR. FICKER, chief of the Statistical Department of Austria, has favoured the Registrar General with the returns of Austria. The population returned above includes Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive. From 1863–68 inclusive the population of Hungary, Croatia, Slavonia, and Transylvania is excluded. From 1853 to 1864 the States of Italy are included; from 1865 to 1868 they are excluded. It is to be hoped that the Hungarians will no longer neglect the statistics of their country.

TABLE 29.—Number and Proportion per 1000 to Population of Marriages, Births, and Deaths in England, France, and in Austria, 1853–68.

(The returns relating to France are supplied by M. LEGOYT, Director of the Statistical Department of France. Those relating to Austria are supplied by DR. FICKER, Chief of the Statistical Department of Austria.)

* The returns for France in the years 1861 to 1866 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt has revised the population and the numbers of marriages, births, and deaths for the years 1853–65.

† The returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive. From 1863–68 inclusive the returns are exclusive of Hungary, Croatia, Slavonia, and Transylvania. From 1853 to 1864 the States of Italy are included; from 1865 to 1868 they are excluded. For the years 1860–62 the numbers for Hungary and its annexed territories have been estimated.

‡ In France in 1865 and 1866 cholera was prevalent.—(*M. Legoyt.*)

§ Dr. Ficker attributes the excessive mortality in the year 1866 to cholera and war.

The British Army.

During the year 1868 the average strength of the British army at home and abroad, as shown by the returns with which I have been favoured by His Royal Highness the General Commanding-in-Chief, was 196,900.

At home the average strength was 89,633 officers and men; and the deaths from all causes were 1088, of which, 44 occurred among officers and 1044 among non-commissioned officers and men. The ratio of deaths per 1000 of mean strength at home, was 9·45 in the former, and 12·29 in the latter.

* The new law which in 1866 removed civil registration from the parochial authorities to the communes, caused a marked decrease in the number of Marriages. Although the decrease is generally attributable to this cause it should be stated that a large number of Marriages were contracted in the previous year, in order to evade the law which was about to come into operation. On the other hand it should not be forgotten that in 1866 many of the Marriages continued to be celebrated at church without being registered, and are consequently not taken into account in the statistical department.

Note.—Dr. Maestri, writing on the 7th December 1868, adds: "Two facts are to be observed in the Tables of 1867 — "The decrease of births and the remarkable increase of deaths. The cause of the former may possibly be found in the "dearness of provisions, produced by the failure of the harvest in many states of Europe, from the effects of which Italy "also suffered by rebound of the disaster. In respect to the increase of deaths, we perceive in that fact the influence of "cholera, from which about 117,000 persons died in 1867."

* The return of the estimated population, and the number of births and deaths in Spain in the year 1868, was not received in time for publication.

Note.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for the Years 1861-7 has been deduced from the Excess of Births over Deaths in each Year. This method of estimating the population is sanctioned by the Junta General de Estadistica.

In Great Britain the death-rate of officers was 11·52, of non-commissioned officers and men 13·28 per 1000 of mean strength. In Ireland the respective rates were 2·74 and 9·14 per 1000. Compared with the results for the previous year the ratios show a reduction in the mortality

TABLE **37.** — **Annual Rate of Mortality** per 1000 amongst the OFFICERS and NON-COMMISSIONED OFFICERS and MEN in the **Army Abroad**, in each of the Years **1858–68.** (Deduced from the Strength and Deaths as given in the two preceding Tables.)

YEARS.	OFFICERS.	NON-COMMISSIONED OFFICERS and MEN.
1858	35·13	67·01
1859	21·11	33·96
1860	16·39	26·03
1861	15·74	25·67
1862	13·46	19·81
1863	15·86	16·82
1864	17·35	18·93
1865	15·76	21·02
1866	12·64	15·49
1867	13·33	20·66
1868	13·07	16·16

The average strength of the army abroad in 1868 was 107,267 ; the deaths were 1716, viz., 75 among officers, and 1641 among non-commissioned officers and men, yielding a death-rate per 1000 mean strength of 13·07 in the former and 16·16 in the latter.

Compared with the results for 1867 there is a slight decrease in the mortality of officers, and a considerable decrease in that of non-commissioned officers and men of the British army abroad.

Births and Deaths of British Subjects at Sea.

The strength of the mercantile marine increased from 196,340 in 1867 to 197,502 in the year 1868. The number of deaths reported to the Registrar General of Seamen during the year was 5,237 or 26·6 per 1000 of strength. The deaths from different causes compiled from a return furnished by the Registrar General of Seamen, are given in page lxxiii.

Of the 5,237 deaths, more than three-fourths occurred from the following causes: drowned by wreck, 1785; drowned by accident other than wreck, 1141; fever, 340; dysentery, 216; cholera, 175; consumption, 171; and yellow fever, 155. Twenty-six deaths are referred to scurvy against 52 in the previous year. There were 16 deaths from murder and homicide, and 23 deaths from suicide. Of the total deaths, 1,056 occurred at ages under 20 years, 2,877 at ages 20 and under 40, 433 at ages 40 years and upwards, and 871 at unknown ages.

Table **41.—Number** of **Births** and **Deaths** of **British*** **Subjects at Sea,** exclusive of Soldiers, Marines, invalided Seamen from the Royal Navy, and Seamen on Ships' Articles, in the Years **1856–1868**, reported by the Captains or Commanding Officers of Vessels to the Registrar General of Seamen at the Termination of their respective Voyages in Ports of the United Kingdom.— (Furnished to the Registrar General by the Registrar General of Seamen.)

	Total	4,540	2,657	7,197

* British *subjects* are not particularly described in these returns, but foreign names have been excluded. A column headed *Place of Birth* was formerly contained in these returns, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. British and Foreign *seamen* are distinguished.

† The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 184 in 1866, 97 in 1867, and 81 in 1868. The number is 1,545 in thirteen years, which, if added to the 7,197 above, makes 8,742, the total number of deaths of British subjects at sea in 1856-68, exclusive of those of merchant seamen.

The number of births and deaths among British subjects at sea reported to the Registrar General of seamen in 1868, exclusive of seamen, soldiers, and marines, amounted to 272 and 585 respectively.

Marine Register Book.

It is required by the Registration Act and the Passengers' Act that captains or commanding officers of British vessels should transmit to me the particulars of all births and deaths that occur at sea amongst English subjects. The entries for 1868 in the Marine Register Book which is kept by me are 115 births and 251 deaths; but the returns are far from complete.

Names on the Registers, and Searches.

The names of all persons whose marriages, births, and deaths in the 31½ years (from the middle of 1837 to the end of 1868) have been recorded in the registers amounted at the end of that period to the number of 42,052,886, of which 1,621,404 were entered in the last year of the series. Respecting facts recorded of this accumulating list of persons inquiries are daily made at this office with the view to procure evidence of birth, death, or marriage.

The number of searches for registers at the Central Office continued to increase during 1868. In the indexes prepared under the Registration Act 11,926 searches were made, and 10,257 certificates were given; the searches for non-parochial registers were 980, and the certificates granted 810. The total amount received in fees for searches and certificates, and paid into the Exchequer was 2,031*l.* 11*s.* The numerous searches for registers of births for purposes connected with the Factory Acts, being made without charge, are not included in the above.

The Return of the Chief Registrar of the Court of Probate shows that the number of probates and letters of administration granted at the

In the 17 years 1852–68	8,049,435	63,699	20·9

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. Since 1867 the return *includes seamen dying ashore in foreign parts*, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occurs in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar-General of Seamen.

principal Registry in the year 1868 was 14,387. The value of the effects was sworn under 54,797,015*l.* The returns furnished by the district registrars show that the number of probates and letters of administration granted in the 40 district registries in the same year was 21,905. The value of the property under which these probates and administrations were sworn was 39,243,246*l.*, making with the amount in the principal Registry 94,040,261*l.*

A full Report on the Causes of Death in England, addressed to me by Dr. Farr, will be found in Appendix A., p. 197, and accompanying the usual abstracts are detailed tables of considerable interest relating to the violent deaths registered during the year 1868. His Report to the International Statistical Congress held at the Hague will be found in Appendix B., p. 235.

I append some remarks which in July 1869 I submitted to the consideration of the Royal Sanitary Commission. (*See* Appendix C., p. 285.)

Strong representations having been made to Her Majesty's Government that I should not register any death until the fatal disease had been inquired into and certified in writing by a legally qualified medical practitioner, that I should register all still-born children, and that I should establish a system for recording and publishing all cases of diseases not fatal, I have there stated my objections to these proposals.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

1868	9,581,208	19,517,094	12,954,584	42,052,886	11,926

NOTE.—The numbers registered in 1837 are for the Half Year ending December 31st.

Progress of Education as indicated by Signatures of the Marriage Register.

Now that so much attention is being directed to the subject of education, and a comprehensive measure has been submitted to Parliament by Her Majesty's Government, I have thought it desirable to publish the following extracts from my annual reports, relating to the state of elementary education of the people, as indicated by the proportional number of males and females who signed the marriage register in writing.

(1839.)

"In 15 English counties and in North and South Wales, in the year 1838–39, more than *40 per cent. of the men were unable to write their names;* and in 19 English counties, in the West Riding of Yorkshire and in Wales, more than *half the women* were similarly deficient . . . . in the whole of England and Wales, out of 121,083 couples married, there were 40,587 men, and 58,959 women who could not write." *Second Annual Report, p.* ix.

(1844.)

"The slow progress of instructions in the six years 1839–44, is evinced by the facts that 66·3 per cent. of the men wrote their names in the first, and 67·6 per cent. (only 1·3 more) in the last year (1844); while 50·5 per cent. of the women wrote their names in the first, and only 50·8 per cent. in the last year. I fear that the records of future years, in exhibiting the results of the inadequate means employed to educate the present generation of youth, will be as little flattering to our age as the actual returns are to our predecessors. The insufficiency of the national education is the more to be regretted, as the means of education exist, and the funds left for educational purposes, if properly applied, in the charities and public institutions, would, with some assistance from Parliament, supply the children of the poor with the sound knowledge which the scanty earnings of the parents do not enable them to purchase. The annual income of endowments for education is 312,544*l.*" *Seventh Annual Report, p.* xvi.

(1845.)

"It has recently been shown, in an analysis of the criminal returns, compared with the facts published in previous reports, that crime is most prevalent in the districts where in proportion to the whole the fewest numbers can write. It is found, that out of 22 different combinations formed of the various districts of England and Wales, in every instance there is an excess of crime where there is the least education or instruction; and, comparing the respective sections of each group of counties, it will be seen that there is an average excess of 25 per cent. of crime in the sections of inferior education over that of higher education; and in some districts the excess is as much as 44 per cent." *Eighth Annual Report, p.* xxxiii.

(1853.)

"It may be here useful to inquire, of what value is this test? as by some it has been misunderstood, and by others mis-stated.

"164,520 men, of whom about *five-sevenths* were of the age 20-30, and the same number of women, of whom *five-sevenths* were also of the same age, and the rest younger or older, went through the various marriage ceremonies in the established churches, in the chapels of protestant dissenters, in the Roman catholic chapels, in the meeting houses of various kinds, and in the register offices. At the end of the ceremony the young husband and wife are invited in all cases to sign the register book, in the presence of the officiating minister or the registrar; they having the option, if they cannot write, to sign by making a *mark* against their names.

"The parties are not asked whether in their own opinion they can or can not write, but are asked to *write their names* on an important occasion, when on many accounts it is desirable that they should append their names, in their own handwriting, to a public register. The abstracts which have appeared in my reports, show how many men and how many women under these circumstances *do sign with marks.*

"Two questions are raised on these signatures: Is the man or the woman who signs with a mark unable to write? Are the men or the women who write their names, able to write anything else? Some men and women who can write imperfectly, do undoubtedly sign with marks. Upon the other hand, some persons can write their names, who cannot write a letter or keep an account in writing. The former class is perhaps the most numerous. Some of the 30 men, some of the 44 women, who sign with marks *can* write their names. Some of the 70 men and the 56 women who write their names, write little else; and are evidently unpractised writers, as their signatures are often almost illegible; not the flourishes of penmanship in which some men conceal the letters of their name, nor the undecipherable scrawl in which others write, but the uncouth, ill-formed letters of men and women who have never advanced at school beyond the first rudiments.

"Looking at both sides of the question, the obvious inference is, I believe, correct; and we have practically 49,983 young men, and 72,204 young women unable to write, out of 164,520 of each sex who married, and will be the fathers and mothers of the next generation of English men and English women.

"Of these persons unable to write, it is known that large numbers are unable to read.

"On the hypothesis that the numbers who can write in the ordinary sense of the word are understated or are overstated, the test is still available for purposes of comparison; as the timidity which prevents some men and women from writing their names, or the vanity which prompts others to try who can scarcely put letters together, must be almost equally powerful in the several counties of England. These disturbing causes leave the important fact unexplained, that in *ten* counties from 15 to 28 men, and in ten other counties from 39 to 50 men, in 100, sign with marks when they are required to write their names.

"The value of this test is also questioned upon the ground that it is, in itself, no proof of education; and it must be at once admitted that at the utmost it shows only how many out of a given number can or cannot write. Many of the men and women who cannot now write, as in the days of old when barons and knights signed with marks, possess great intelligence and have acquired many useful arts; so thousands, on the other hand, who read and write, are ill educated, and know nothing of those liberal arts and sciences which enlarge, refresh, and invigorate the mind as the sunshine and showers fertilize and adorn the soil of England.

"Yet reading and writing are no unimportant acquirements. They are the gates of the temple of learning, and open at once access to many of its most delightful courts, where the mind can range freely among the creations of man and the inspirations of God. They are useful to a man in his business, and they facilitate in a wonderful and new way his communications with his fellow men. What a striking difference would there be between two nations, the one consisting of people who could all when they married read and write, the other of people who could not read and write! The men of the latter nation would derive no advantage from the great discovery of printing, nor from the earlier and still greater discovery of the art of writing; that is, of transmitting the ideas of man to man through the sense of sight as well as through the sense of hearing by the voice. They could only converse with their equals in ignorance and capacity in their immediate

neighbourhood; while the men of the favoured nation, who could read and write, could call into their chamber at will some of the loftiest spirits of the present and of past ages; they could converse with the apostles and the prophets, with the poets and the historians of their own country, in health and in sickness, in the hours of joy and of sadness—in the 'valley of the shadow of death' itself.

"One of these nations we have still amongst us; we see them in the unobtrusive figures of the marriage muster interspersed all over the land, in every county and parish, still in the dark, or receiving only feeble rays of the reflected light that irradiates our path. In the same year 612,391 children were born. Under the present system a large proportion of these children, and of the children born year after year, will evidently grow up in some counties without receiving adequate instruction, unless efforts are made at once to extend education in the most benighted counties. Why should 61 in 100 children in Lancashire and Staffordshire, 56 in Bedfordshire, grow up into womanhood unable to write, when only 25 in 100 marry ignorant of this art in Surrey (extra Metropolitan) and in Westmorland?

"This question can be easily, but very unsatisfactorily, answered by referring to the occupations of the children. The precise circumstances of the nation among us that cannot write should be ascertained, as well as the means we have at our disposal for rendering them the aid which every man would be glad to render, who by the accident of birth or by some other accident of nature is able to write himself. It will probably be found that different agencies may be applicable in the northern, southern, and midland counties; but it is already evident that the great work of the education of the whole people cannot be carried out until a system of schools and colleges, easily accessible to all, becomes virtually one of the great institutions of the country.

"In fine, the arguments that the marriage registers supply in favour of the extension of education cannot be set aside by a few stories about young girls, terrified in the presence of the clergyman, making marks when they are able to write their names. The marks of the men alone are conclusive." (*Sixteenth Annual Report, pp.* iv–ix).

(1854.)

"The proportion of men who signed with marks fell from 32·7 in 1841, to 30·0 in 1854; so that the numbers of men left in this benighted state fell by 2·7 per cent. in 14 years. The women who made their marks were 48·8 per cent. of the whole number in 1841, and 42·7 per cent. in 1854. The decrease is 6·1; or 1 in every 8 of the original number. This shows that the education of the people made some progress in the years 1828–1841; but it is still deplorable to find that in the present day 30 in every 100 of the fathers, and 43 in every 100 of the mothers, of the next generation of Englishmen have been so imperfectly educated, that they do not write their names, but sign the marriage registers with marks; while many of those who write their names write very imperfectly.

"One of the most acute thinkers that this country has ever produced, pointed out in 1745 the necessity of instituting a settled system of education in England.* In ancient times all classes of the lay population were unable to write; but in the present age all the middle as well as the higher classes can write, and the poor children consequently who grow up deprived of this art are placed at much greater disadvantage relatively to the other classes than the children of the lower classes in the middle ages; which, moreover, threw open the hospitable doors of the colleges to poor scholars. Now also elementary learning is more useful

* Bishop Butler.

than it was formerly: no business can be carried on successfully without it; it facilitates and lightens as well as sweetens labour; it cements the ties of blood and friendship; and, finally, it gives good men some additional power in controlling the dark passions of our nature; for learning is the atmosphere in which the words of the wise reverberate over the souls of nations, drawing them from error and injustice to truth and righteousness.

"The provision under the Poor Law against starvation is undoubtedly made at great cost to this nation; but it is a cost well incurred, for not only are many lives saved from death by accidental destitution, but the heart of the whole labouring population is sustained amidst the conflicts of life, and the property of the country enjoys a degree of security which is possessed by the property of no people where the destitute poor have no legal claim to relief.

"By paying in the form of poor rate a portion of the profits of property, the property is enhanced in value, and the rest of the profit is enjoyed by its owners in security. That discovery was made in England some centuries ago; and it has been carried out more effectually during the present century.

"The utility of a system of education, to secure the whole population against the dangers of ignorance, is as evident as the utility of a system of poor laws. This is ably argued in a discourse by the author of the 'Analogy;' and no argument in his great work deserves more attention, for none is more conclusive. If the preservation of the lives of poor children is wisely provided for by a regulated legal provision, so ought also a certain provision to be similarly made for the cultivation of their intelligence: '*For the public is as much interested in the education of poor children as in the preservation of their lives.*'

"How many children have for a century, notwithstanding Butler's reasoning, been left out of the pale of education under the voluntary, or what may more appropriately be named the *casual system* is evident; and the wisdom of educating the whole of the rising generation, whether they live in Cornwall or in Northumberland, in Staffordshire or in Bedfordshire, in the most benighted county or in the county of greatest comparative light, is now self evident. But to carry out this vast purpose the casual system is unequal. It would require a century probably for the development of its resources, which even then would never reach large sections of the population; and in that time nearly every child and man now living would be dead. The voluntary system would not be superseded, but would be the necessary supplement to the established schools; as all our institutions that work most satisfactorily have a mixed character,—so the zeal of individuals and of classes in supporting their own private schools would stimulate the local parish boards of education.

"If there is anything in which the holders of rated property are especially interested it is the education of the people; and to the national system, in which all are interested, all should contribute in the equitable proportion of their means.

"It will be a happy circumstance when the men and women of England and Wales are educated, and can not only write their names and read their Bible, but are familiar with the great works of the English classical writers, know something of common things, and are acquainted with many of the productions, the phenomena, and the laws of nature. It will be as a new revelation; for then, indeed, to them that sit in darkness light will come. Might not the produce of the intelligence which would burst forth from the people, who, down to the lowest classes, have in them the elements of all knowledge, as experience has shown, justify the expenditure? What more profitable investment can the nation make of a few farthings in the pound of its annual produce?" (*Seventeenth Annual Report, pp.* vi–xii.)

(1862.)

" It is gratifying to observe that although the number of persons who are unable to affix their names to the marriage register is greater than could be wished, yet it is year by year decreasing, for while in the year 1845 no fewer than 41·4 in every 100 persons married signed the register with marks, the proportion has been gradually reduced until in 1862 not more than 28·5 exhibited inability to sign their names. Of every 100 males who married, 23·7 signed with marks, while 33·2 in every 100 females who married signed in the same manner in 1862. It will be observed that as regards this test of education the Northern Counties contrast favourably with the rest, Westmorland occupying the most creditable position, and in no other county do the females write so well. At the opposite end of the scale is Monmouthshire, in which county nearly half the people who marry exhibit an inability to sign their names. There is great need of the schoolmaster here, as well as in South and North Wales generally, and it is to be hoped that future years will show that the beautiful principality, which gives the heir to the British throne his renowned title, will not, as now, be conspicuous among the least educated portions of our island. The education of the children of the principality will be retarded so long as they speak the Welsh language in childhood. At the Census of 1851, when the last educational enumeration took place, it was found that the number of scholars attending day schools was 2,144,378, or one in every 8·36 of the population, while 318,000 teachers were engaged in educating 2,407,642 scholars in Sunday schools. Since that time the attention of the government and of the public has in a greater degree been directed to educational requirements, and the examination ordeal which the candidates for even the most subordinate public appointments have now to undergo has also stimulated scholastic progress, so that at the present time we are prepared for the information that the proportion of scholars to population is much greater than in 1851.

" The Occupation Abstracts of the Census of 1861 disclose that while the population increased since 1851 12 per cent., the scholars of all ages increased 37 per cent. in the same period, the male scholars increasing 33 per cent., and the females 42 per cent. The number of scholars, including those receiving private tuition at home, but exclusive of Sunday school children, in 1851, was 2,297,232, and in 1861 3,150,048; the number of scholars under 5 years of age was doubled in the ten years. This increasing stream passing through the various schools of the country is asserting its presence in the marriage registers, and has reduced the proportion of those who signed with marks, which 18 years since was as high as 41 per cent., to little more than 28 per cent. of those who married in 1862.

" The efforts to extend the benefits of elementary education are bearing every year a more abundant harvest of good results, and should encourage us to increase our exertions until every man and every woman shall be able to attach their names to their marriage register.

" It is impossible to calculate how much the value of the work of the population is increased by the increase of its intelligence." *Twenty-fifth Annual Report, pp.* vi. vii.

(1864.)

" The bridegroom and the bride invariably sign the marriage register. In the year 1864, of 180,387 *couples* married, it is found that:

" The bridegroom *and* the bride wrote their names in 106,569 instances.

" The bridegroom *or* the bride made *a mark* instead of *writing* the name in 47,236 instances. [15,416 men and 31,820 women.]

" The bridegroom and the bride both *signed with marks* in 26,582 instances.

" 41,998 bridegrooms and 58,402 brides made their marks instead of writing their names.

" What are we to infer from these facts? Not, say some clergymen, that all the women who make marks are unable to write their names, for they are sometimes so 'nervous' that they decline to write, and make crosses. This may be true; but against any women deducted from the ranks of ignorance on this ground must be set a large number of women who write their names so badly, as to prove that they have no command over writing for any useful purpose. Indeed it may be safely affirmed that 58,402, or 32 in 100, is an under-statement rather than an over-statement of the number and proportion of young women in England incapable of writing for any practical purpose.

" Although nothing has been said by the clergy of the timidity of men, it is probable that in this matter, and on this occasion, the women are as brave as the men, to whom similar remarks are therefore applicable.

" In the absence of an educational examination of the whole adult population this test may be employed, and may lead to some practical results.

" The annexed Tables display the various shades of ignorance in which large masses of the adult population are still plunged.

ENGLAND, **1864.** **Proportion** of **Men** and **Women** who **signed** the **Marriage Register** in **Writing** in the **several Counties.**

MALES.		FEMALES.	
Counties, &c.	Of 100 Men Married.	Counties, &c.	Of 100 Women Married.
Monmouth	58·1	South Wales	44·1
Stafford	61·6	Monmouth	48·2
South Wales	62·8	Stafford	51·5
Bedford	63·1	North Wales	51·3

Hereford	70·5	Herts	68·9
Berks	72·1	Leicester	69·1
Wilts	72·1	Warwick	69·3
Bucks	72·3	Cambridge	70·0
Dorset	73·3	Cumberland	70·0
Somerset	74·1	Suffolk	70·7
Notts	75·1	Bucks	70·8
Lancaster	75·5	Hunts	71·7
Northampton	75·7	Norfolk	72·0
Durham	75·8	Northumberland	72·5
Oxford	75·9	East Riding	72·8
England	**76·7**	Northampton	72·9
Warwick	76·7	Somerset	73·1
Chester	76·7	Gloucester	74·8
West Riding	76·9	Hereford	74·9
Derby	77·2	Essex	75·0
Lincoln	78·2	Wilts	75·6
Middlesex	78·4	Lincoln	75·8
Gloucester	78·6	North Riding	75·9
Leicester	78·7	Devon	76·0
Kent	79·0	Dorset	76·9
Surrey	79·4	Berks	78·3
Devon	80·0	Oxford	78·3
Cumberland	80·3	Kent	78·7
Sussex	80·7	Westmorland	79·4
North Riding	81·0	Middlesex	80·9
Hants	81·1	Hants	82·2
East Riding	82·5	Rutland	82·5
Northumberland	83·2	London	82·6
London	89·1	Surrey	83·2
Westmorland	89·7	Sussex	83·8

" It should be recollected that the marriageable women of a country are a selected class, and include very few of the infirm, deformed, idiotic, or others incapable of learning. They can nearly all learn to write if they have the opportunity. And upon turning to the Report of Dr. Stark, addressed to the Registrar General of Scotland,* I find that all the women of the county of Kinross who married wrote their names in the registers; the proportions per cent. were also 98 in Peebles, 98 in Kincardine, 96 in Roxburgh, 96 in Kircudbright, 94 in Perth, 92 in Fife, 91 in Edinburgh, and 93 in the far off Orkneys. Under these circumstances he must be an extreme optimist who can contend that the state of education of the women of England is the best possible, when it is found that by the same test in 100 of the marrying women of the county of Bedford only 55 write their names, in Cornwall only 60, in Stafford only 52, in Lancashire 53, in the West Riding only 57, in Durham only 62, in Monmouthshire only 48, in North Wales only 51, and in South Wales only 44.

" The women of London come as immigrants in large proportions from every county; 83 in 100 of the brides wrote their names. Middlesex, Surrey, Sussex, Hants, Rutland deserve to be mentioned as counties in which 80 or more of 100 brides wrote their names in the registers. In Westmorland 79 women wrote their names; but it is in the education of the men that the Northern Counties approach and even excel, several of the Scotch counties.

" Of 100 men marrying, 90 could write their names in Westmorland, 89 in London, 83 in Northumberland, 83 in the East Riding, 81 in the North Riding, 81 in Hants, 81 in Sussex, 80 in Cumberland, 80 in Devon. The proportion then goes on descending deplorably from county to county until it falls to 63 in Bedford, Hertford, and South Wales, 62 in Stafford, and 58 in Monmouth. The excessive ignorance of the colliers of Staffordshire and Wales is a cause of incalculable evils, among others, of explosions, and probably of strikes.

SCOTLAND. **Proportion** of **Men** and **Women** who **signed** the **Marriage Register** in **Writing** in **1862** and **1867.**

Divisions.	COUNTIES.	1862.		1867.†	
		Of 100 Men Married.	Of 100 Women Married.	Of 100 Men Married.	Of 100 Women Married.
	SCOTLAND - - -	90·0	79·7	89·4	79·3
III.	Nairn, Elgin, Banff, Aberdeen, Kincardine -	96·5	90·6	96·7	90·5
VIII.	Roxburgh, Dumfries, Kircudbright, Wigtown	95·3	92·1	95·3	91·3
VII.	Linlithgow, Edinburgh, Haddington, Berwick, Peebles, Selkirk - - - -	94·6	90·3	93·9	89·9
IV.	Forfar, Perth, Fife, Kinross, Clackmannan -	93·6	85·4	93·8	84·5
I.	Shetland, Orkney, Caithness, Sutherland -	92·2	81·3	93·2	83·1
VI.	Renfrew, Ayr, Lanark - - - - - -	86·5	71·0	84·7	70·4
V.	Stirling, Dumbarton, Argyll, Bute - - -	86·4	75·7	89·	78·5
II.	Ross and Cromarty, Inverness - - - -	67·5	50·5	66·3	49·8

Thus in all the counties around Aberdeen 97 in every 100 marrying men and 91 in every 100 women wrote their names in each of the years 1862 and 1867. It is only in the highland counties of Inverness, Ross, and Cromarty that the men and women approach or surpass the degree of English ignorance. The old tongue is the same hindrance to the education of the people as it is in Wales.

† The results for the year 1867 are here inserted for comparison.

* Eighth Detailed Annual Report of the Registrar General of Scotland—Abstracts of 1862, p. xxiii.

"In Scotland we discover a state of things highly creditable to the people of that part of the United Kingdom; and it is difficult to explain the difference in any other way than that in the general struggle for the church property at the Reformation the people had the good sense to endow the schoolmasters with small stipends, and not to give the whole revenue of the land either to the clergy or to the nobility. Between the minister and the lord stood the schoolmaster in the presence of the people. The advantages of the Scotch system of education became so apparent that it was expanded in the period of the civil wars (1646), and firmly established after the Revolution by the celebrated statute of William and Mary in 1696. The endowment was small, and stimulated instead of slackening the exertions of the schoolmaster, who had to depend largely on his own industry, zeal, and popularity for support. M'Culloch estimated the average fixed stipend at 25*l.* 10*s.*, exclusive of house and garden; the school fees at 22*l.* 10*s.*; the income from all sources at about 63*l.**

"It is impossible to say how much Scotland owes to this system of schools, and to the universities, which are accessible to the youth of the kingdom. There was probably as much revenue proportionally devoted to education in England as in Scotland, but the money was in various ways misappropriated, so that before the Reform Bill passed, and even in 1837 when the registration of marriages commenced, the working classes, entirely ousted from the educational charities and universities, were in the most deplorable state of ignorance. *One* in *three* of the young men, and *one* in *two* of the young women, of England could not write their names in the marriage register even in 1841, after some efforts had been made in the cause of popular education.

"Happily a considerable improvement is visible in the registers; *one* in *four* of the men, and *one* in *three* of the women, now sign with marks. In twenty-three years the marks-men have fallen from 33 to 23; the marks-women from 49 to 32 in 100.

"Still in common education the great body of the people of England are many degrees below the people of Scotland, and it is impossible to calculate the advantage this superiority gives the Scotchman over the Englishman at home and abroad. The education of the common people of Scotland is a benefit to the world; without it Watt could not have invented, Burns could not have written. The brightest boy in a village without a school has no chance of distinction, except by accident.

"The success of common education in Scotland speaks well for the working of a rate, mixed with a paying system for children. But before the education of the children of to-day can produce any results on the minds of the marrying fathers and mothers of England, 10 or 15 years may elapse. Cannot nearly all these adults be taught at once to read and write by some simple method? Is there no machinery for grinding reading and writing into the heads of the young agricultural labourers of England who are about to marry within the next five years?" *Twenty-seventh Annual Report, pp.* xvi–xix.

(1867.)

"As marriage is contracted on an average at the age of 27, the returns show the state of education among the marrying men and women of the country; and it is evident that the schools now existing will produce no effect whatever on the great mass of the youthful population above the school age, who will in the next 12 years become the fathers and mothers of the following generations. We shall endure all the evil

* Statistics of British Empire, vol. ii. p. 373.

consequences of their ignorance. They form an immense mass of the existing population. The number of men and women of the ages 15 and under 27, amounts to about 4,731,388; and allowing for their possible superiority over those who married in the last year, at least *a million* of them are not able to write their names. The number who do not write, estimated by the standard of 1867, is 1,182,849. When we consider that many who write their names can scarcely read, and know little of the elements of arithmetic, to say nothing of any other learning, it becomes a question whether the country ought not to make a strenuous effort to educate this great mass of the youthful *adult population.* A generation would thus be partially saved.

"No existing school system provides for the instruction of adults; and they could not be taught as children; but many plans have been partially tried, and by careful adjustment might no doubt be rendered successful. The soldiers and sailors might all be taught to read and write; so may the artisans of the country. The agricultural labourer too might in some way be taught." *Thirtieth Annual Report, p.* ix.

Summary of the Quarterly Reports, 1868.

First Quarter.—January, February, March.

The United Kingdom.—The Registers of the United Kingdom show that the births of 265,502 children, and the deaths of 162,986 persons of both sexes, were registered in the three months ending on March 31st. The recorded natural increase was 102,516; the native emigrants were 21,975.

The number of persons married in the quarter ending March 31st, 1868, was 107,180.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the quarterly reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of the United Kingdom in the middle of 1868 is estimated at 30,369,845; that of England and Wales amounting to 21,649,377, of Scotland to 3,188,125, and of Ireland to 5,532,343. The corrected death-rate of the quarter is 2·23 per cent.; the birth-rate 3·68; the marriage-rate for the previous quarter 1·83.

England.—The marriage-rate, which had been high in three previous years, suffered a depression in 1867, continued low through the year, and was still lower in the first quarter of 1868. In the first three months of 1868 the birth-rate was lower than it had been in four previous winters, but it did not fall below the average of the winter quarters of ten years. The most notable feature is furnished by the returns of mortality, which exhibit a very striking decrease. An improvement of the public health was apparent in 1867, and the facts now under review again indicate such a condition of health as, considering that it prevailed in the winter months, must be regarded with much satisfaction.

Marriages.—The number of marriages in England in the winter quarter (ending 31st March) was 36,696. Although absolutely the number was a little higher than it had been in the corresponding quarter of 1867, when the low number 36,441 was registered, it was less in reference to an increased population. The marriage-rate (viz., proportion of persons married in the quarter to persons living) was 1·364 per cent., the average being 1·398. The formation of new family connexions is invariably less active in the winter quarter than in any other season. The ability to marry had in some degree spent itself in the more convenient autumn, immediately preceding, of the past year.

By comparing the numbers of marriages in the winter quarter in the three years 1866–67–68, there is seen a manifest decrease in the celebrations in London; a decided decrease also in Staffordshire, and in Monmouthshire; and on the other hand a clear increase in Lancashire.

Births.—Of children born in the first three months of 1868, the number was 198,584; the numbers in the corresponding period of 1866–67 having been 196,753 and 194,763. In some parts there was a decrease, as in the Eastern Counties, where the births declined from 10,109 and 10,061 to 9959. There was a decrease also in the South Western and West Midland Counties. In Cornwall, which belongs to the South Western Division, and where 3013 births were registered, the decrease is very marked, and the returns of that county both of marriages and births are significant of the removal of families dependent on mining, and perhaps other branches

of labour, to the colonies and foreign parts. The births in London in the quarter were 29,857 ; in Cheshire and Lancashire they were 31,961.

The annual birth-rate of England in the quarter was 3·693 per cent. against an average of 3·674. In the four preceding winters it ranged above 3·700 ; and in those of 1865–66 was about 3·770.

The birth-rate in Edinburgh was 3·655 per cent. ; in Hull 3·679 ; in the borough of Birmingham 3·724 ; in the city of Bristol 3·822 ; in London 3·837 ; in Manchester 3·863 ; in Newcastle-on-Tyne 3·929 ; in Bradford 3·966 ; in Sheffield 4·019 ; in Salford 4·025 ; in Glasgow 4·086 ; in Liverpool almost the same ; in Leeds 4·591.

Increase of Population.—The births in the quarter were in excess of deaths registered in the same time by 78,908. This excess constituted that natural increase of population, the effect of which is impaired by emigration.

From ports in the United Kingdom there went in the quarter 25,986 emigrants, of whom 7926 were persons of English origin, 1917 were Scotch, 12,132 were Irish, and 4011 foreigners. Of the total emigration 23,528 persons, half of whom were of Irish birth, embarked for the United States. The Australian Colonies attracted 1319 ; British North America 57.

The amount of emigration was nearly the same as in the winter quarters of 1865 and 1867, but considerably less than in 1864 and 1866.

Prices, Pauperism, and the Weather.—In the first three months of 1868 the average price of consols was 93. The price of wheat rose to 72*s.* 2*d.* a quarter ; in the same period of 1867 it had been 60*s.* 7*d.*, and in that of 1866, 45*s.* 6*d.* In the last eight quarters it has mounted steadily from 45*s.* to 72*s.* At Leadenhall and Newgate markets the same prices ruled for beef and mutton sold by the carcase ; inferior qualities 4¼*d.* per lb., superior 6½*d.* per lb., mean price 5⅜*d.* Both beef and mutton were cheaper last quarter. The best potatoes were sold in the Southwark market at 147*s.* 6*d.* per ton, as the average price. In the corresponding periods of the two previous years the prices were 72*s.* 6*d.* and 137*s.* 6*d.*

The returns of pauperism, which exhibited last quarter a serious increase, continue to be very heavy. In the following figures they may be compared with those of two previous winters :—

	In-door Paupers.	Out-door Paupers.
In three months ending 31st March 1866	139,546	759,402
„ „ 1867	147,620	832,364
„ „ 1868	159,720	861,044

These numbers represent the quarterly average of persons relieved on the last day of each week.

For eleven days at the beginning of the year the weather was cold ; but on the twelfth the wind which had been blowing from the north-east changed to south-west ; the temperature rose and continued high till the end of the quarter, with exceptions that were few and unimportant. During these eighty days the excess of temperature above the average was 3½° daily. February was unusually warm. The weather in that month was vernal in its character ; vegetation made rapid progress, and at the end of it trees and shrubs were budding, and reports of winter-sown wheat were favourable. Easterly winds were of less frequent occurrence both in February and March than is usual in those months. The latter month, though less settled than February, was also favourable to agricultural operations, and at the end of the quarter vegetation was for the period in a very advanced state. There were violent gales on the 20th January ; and afterwards on the 31st and the next day there were other gales of extraordinary violence. The mean temperature at Greenwich was above the average of 97 years in each of the three months ; the excess in February was 4°·6. The rainfall was 6·6 inches, which is 1·6 above the

average. Two-thirds of the rain fell in January ; in the two other months the quantity was deficient, but there was the greatest diversity of amounts collected in different localities. Five or six inches were measured at Newcastle-on-Tyne, Liverpool, Hull, Dublin, Leeds, and London ; amounts from 7 inches to 10 inches at Sheffield, Birmingham, Edinburgh, Manchester, Salford, Bristol ; while at Glasgow the fall far transcended these measurements, and was as great as 24 inches. At Cockermouth and Allenheads it was 19 inches.

Deaths ; and the State of the Public Health.—In the quarter that ended March 31st the fine weather that has been described, when February, was more like a spring than a winter month, exercised its beneficent influence on the public health ; fever and diseases that attack the juvenile population were less prevalent, or, where they prevailed, were probably less fatal than usual in many districts that in other seasons had suffered from their ravages ; and the result was a singularly low mortality. There are only two instances in which the winter death-rate was so low as it was in the period for which the returns have just been received. In the winter of 1846 it was 2·157 per cent. ; in 1856 it was 2·179; in 1850 and 1857 it was respectively 2·261 and 2·298. In the remaining twenty-six seasons it ranged from 2·350 per cent. to 2·910. The death-rate of last winter was 2·226 per cent. against an average (derived from the corresponding periods in the ten years 1858–67) of 2·576 per cent.

The returns both of town and country testify to the higher condition of health enjoyed by their inhabitants. In the large town districts the rate of mortality was 2·40 per cent., the average being 2·76. In districts that comprise small towns, villages, and open country it was 2·01, the average being 2·35. It is a subject for congratulation that at a time when provisions were dear, and the resources on which the working classes depend for food and warmth were in many parts straitened or destroyed, the rigours of an inclement winter were not added to the privations which they suffered.

The total number of deaths registered in England was 119,676, which is less by about 14,000 than in the March quarter of the previous year, and less by 18,000 than in the same period of 1866. The reduction is apparent, by inspection of the tables, in almost every county. Leicestershire must be mentioned as an exception, a circumstance which seems to be due to measles which was there prevalent and fatal in an unusual degree. The county of Westmorland is another instance in which the rule, almost universal, did not hold.

The deaths in London were 17,967, which in the estimated population of the present year represents a death-rate of 2·33 per cent. Within the metropolitan area are wide-spread suburban districts that have much of the country's purity and freshness ; but the general sanitary condition of London has been much improved, and to this fact may be reasonably attributed in no small degree the position as regards health which it holds among large towns. Its rate of mortality was lower than that of any other of twelve large towns in the United Kingdom. In Sheffield, Leeds, Birmingham, it was above 2·30 and under 2·50 ; in Bristol and Newcastle-on-Tyne it was 2·50 and under 2·60 ; in Edinburgh it was above the latter point and under 2·80 ; in Salford it was 2·82 ; in Dublin and Liverpool it was nearly 3·00 ; in Glasgow the death-rate of the quarter was 3·02, and in Manchester the summit of insalubrity was attained at 3·13.

In London the deaths from small-pox in the last quarter were 280 against 526 in the same period of 1867 ; those from measles 452 against 239 ; from scarlatina 368 against 339 ; from diphtheria 119 against 102 ; from whooping-cough 734 against 906 ; from typhus 514 against 565 ; from phthisis 2,184 against 2,369 ; from bronchitis 2,282 against 3,144 ; from pneumonia 1,035 against 1,150.

Intermittent fever prevailed at Wendover in Buckinghamshire ; typhoid fever at Southminster in Essex, where "drains and cesspools are very bad ;" also at Terling where, as is well known, it had spread with violence. Typhus and gastric fever were fatal at Trowbridge, and 10 deaths from typhoid fever occurred in East Stonehouse, 4 of which were in the Royal Marine Barracks, where an outbreak reported in the previous quarter was supposed to have been traced to a contaminated well. Fever broke out in Shackerstone (Market Bosworth), and continued to prevail in Winterton, and at Rainford in Lancashire. The Registrar of Aldbrough, in the East Riding of Yorkshire, states that there were 30 cases of typhus in his sub-district, but only one fatal. A malignant form of diphtheria appeared at the railway station at Rillington in the North Riding, and was readily traced to a well, the water of which was used for household purposes, and into which the matter from cesspools and from other accumulations of impurity had been allowed to penetrate.

Measles visited many districts, and some with fatal effect. In the parish of Corston in Somersetshire more than a hundred children caught the complaint, but only one died of it. The disease was very fatal in Leicestershire ; in Hinckley 39 out of 96 deaths were from measles ; in Whitwick it caused a fourth part of the 81 deaths, and in the east sub-district of Leicester 95 out of 401. It also prevailed in Stockport, Liverpool, and Bradford. Scarlatina prevailed extensively and fatally in the county of Durham, at Manchester and other parts of Lancashire. It prevailed at Tynemouth ; and from Bedlington in the district of Morpeth the Registrar reports that the "220 deaths are about 100 above the average owing to the prevalence of scarlatina, of which there have been 121 cases."

Second Quarter.—April, May, June.

The United Kingdom.—The Registers of the United Kingdom show that the births of 274,386 children, and the deaths of 149,339 persons of both sexes were registered in the three months ending on June 30th. The recorded natural increase was 125,047 ; the native emigrants were 53,136.

The number of persons married in the quarter ending June 30th, 1868, was 112,342.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales. The several facts concerning the other divisions of the Kingdom are set forth in the quarterly reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of the United Kingdom in the middle of 1868 is estimated at 30,369,845 ; that of England and Wales amounting to 21,649,377, of Scotland to 3,188,125, and of Ireland to 5,532,343. The corrected death-rate of the quarter is 2·05 per cent. ; the birth-rate 3·78 ; the marriage-rate for the previous quarter 1·63.

England.—Marriages were less frequent than usual in the spring quarter of 1868 ; the matrimonial depression having continued for the eighteen months that ended 30th June of that year. But while marriages were few, births were many ; and in fact the birth-rate of the second or June quarter attained a point high beyond example in that period of the year. It must be added that the returns exhibit their most satisfactory feature in a reduction of the mortality unprecedentedly great for the spring quarter.

Marriages.—90,728 persons were married in the quarter that ended on June 30th ; and the marriage rate was 1·684 per cent. per annum, against an average of 1·717. The rate has declined since the spring of the year 1866, when it was 1·840. The decline was very striking in London, where the weddings were 8764, 8246, and 8012 in the last three spring quarters. Little falling off is noted in the Eastern, South-eastern, or

South Midland Counties; but in many of the mining districts, and in the manufacturing districts of Cornwall, Staffordshire, Lancashire, and Yorkshire, it was well marked. Even in Bath the marriages, so high in 1866, fell to two thirds of the number in 1868; but Cheltenham, to some extent, restored the balance. Liverpool felt the depression more than Manchester.

Births.—In the three months ending 30th June, the births registered were 202,859. This is the first instance in which the births in England and Wales in a quarter have completed their second hundred-thousand. In the June quarter of 1867 the number returned was 199,660. The births in Lancashire were 28,519, exhibiting a very marked increase on corresponding quarters; this fact is probably the consequence of the return to their homes of factory operatives, who with their families had left the county in the late period of adversity.

The annual birth-rate in the quarter was 3·763 per cent. against an average of 3·637. Though this rate has been equalled or exceeded in the winter quarter, it is singularly high as having occurred in spring, which next to winter is the most prolific of the four seasons.

Amongst the birth-rates in fourteen British towns in last quarter those of Leeds and Glasgow are worthy of remark, for they were 4·48 and 4·56 per cent. respectively. In London, Bristol, Birmingham, and Bradford the birth-rate was about 3·70. In Liverpool and Manchester about 3·90; in Sheffield and Newcastle-on-Tyne nearly 4·00. In Edinburgh it was 4·12 per cent.

Increase of Population.—The births exceeded the deaths of the spring quarter by 92,849. The excess represents the natural growth of population; but the daily flow of people to and from the English shores materially interferes with the result.

The total number of emigrants in the quarter (ended 30th June) was 82,068. Of these, 18,759 were of English origin, who, with the exception of about 5,000, went to the United States. Of the 28,829 Irish who emigrated, a still larger proportion, namely 26,262, were bound to the same destination. Of the total emigration about 67,000 persons went to the United States, about 11,000 to British North America, 3,000 to the Australian colonies. About a third part of the emigrants were foreigners.

Prices, Pauperism, and the Weather.—In the spring months the average price of wheat per quarter was 71*s.* 10*d.*, which has been about the prevailing price during the first half of the present year. In the spring of 1866 the price of wheat was 46*s.* 6*d.*; in that of 1867 it was 63*s.* 11*d.* Of beef by the carcase, at Leadenhall and Newgate Markets, the price per lb. was 4½*d.* for inferior, and 6¾*d.* for superior qualities; of mutton the respective prices were 4¾*d.* and 7*d.* per lb. The mean price of best potatoes at the Waterside Market, Southwark, was 150*s.* per ton. In the June quarter of 1866 it was 77*s.* 6*d.*

The following figures exhibit an increase of pauperism; they represent the average number of paupers relieved on the last day of each week in the June quarter of three years:—

	In-door.	Out door.
1866, Quarter ending 30th June	123,657	734,139
1867, „ „	134,678	779,629
1868, „ „	142,782	801,500

Mr. Glaisher states that the weather has been remarkably fine and warm during the whole quarter, the temperature having almost invariably exceeded the average. April was warm, but not in a remarkable degree, for since 1771 twenty-four Aprils have occurred of higher temperature. The mean temperature of the air in last April was 48·1°. That of May was 57·3°, and was higher than in the same month of any year since 1848. That year and 1833 supply the only instances—if the inquiry is carried as

far back as 1771—in which the mean temperature of the late May has been exceeded. The mean temperature of June, 62·0°, was also high; and since 1771 there have been only six examples of a June when it was higher. The mean temperature of June 1846 rose to the unusual height of 65·3°. But taking April, May, and June together, the mean temperature of these months in the present year has been so high, that no instance of a similar spring occurs within the records of 98 years, with the exception of 1865.

The five months from 1st February to 30th June have been distinguished by having an almost constant atmospheric pressure above the average; the mean monthly excess of pressure was more than 0·1 inch. They have also been distinguished by a deficiency of rain in each month, with the exception of April; the amount below the average in the five months ending June was 2·5 inches; but reckoning from 1st January the fall of rain is very nearly the true fall for the period, the deficiency being only 0·1 inch. The period from 1st January has been distinguished by an unusual distribution of rain; in January it fell to the depth of 4·2 inches, being an excess for that month of 2·4 inches. The drought which was experienced towards the end of the quarter is not attributable, therefore, to a deficiency of rain since the beginning of the year, but to its unequal distribution over these months, there having been a great excess in January and a great deficiency in June, together with unusual evaporation caused by continued high temperatures, extending over a period of five months.

The highest temperature in the shade at Greenwich occurred on 19th June, when it was 87°, and on 13th and 14th June, when it was 85°. These temperatures were exceeded at some places in the Midland Counties.

Notwithstanding the continuance of high temperatures but one thunderstorm occurred at Greenwich during the quarter, that on the 29th of May, on which day the greater part of the rain for that month fell; and generally over the country there have been much less than the usual number of thunderstorms.

For agricultural pursuits the month of April was favourable, and at its end there was every prospect of an early and plentiful harvest.

The month of May was remarkable for brilliant sunshine, high temperature, the general forwardness of the season, and the promising appearance of the cereal crops.

The month of June was favourable to the ripening of the wheat crops, but injurious to grass lands, and to all spring and root crops.

Deaths; and the State of the Public Health.—During 1867 the health of England was good; it was remarkably good last winter, viz., in the first three months of 1868, under the genial influence of weather which has been described as vernal in its character; in the spring months (ending June 30th) which followed, the same beneficent cause was in operation, and again a remarkably low rate of mortality is the satisfactory result. The total number of deaths registered in the spring quarter was 110,010. This is the lowest number that has occurred in any spring quarter since the years 1861–62, when the deaths returned were under 108,000, but when the amount of population was not equal to what it has become since that time.

If last spring is compared with the same season of last year, which was also a period of low mortality, it is found that the deaths in England decreased from 112,355 in 1867 to 110,010 in the present year. But decrease was not the universal rule; for in those periods the deaths in London increased from 15,619 to 17,167; those in Cheshire and Lancashire rose from 19,479 to 19,671; and in the West and North Midland Counties and in Yorkshire the returns discover little fluctuation. On the other hand, if the late spring is compared with a season of much sickness in 1866, when, in the same three months, the deaths rose to 128,551, it will be seen that with the exception of Leicestershire and Durham, the decrease

is traceable in distinct unmistakable characters in the returns of every county in the kingdom.

The following Table exhibits the deaths in LONDON, in the June quarter of the five years 1864–68, from a few special causes :

	1864.	1865.	1866.	1867.	1868.
Small-pox - - -	116	149	396	387	187
Measles - - -	844	208	823	202	741
Scarlatina - - -	593	385	397	248	352
Whooping-cough -	639	842	1146	536	780
Typhus - - -	783	700	666	518	485
Bronchitis - - -	1471	1512	1816	1310	1366
Pneumonia - - -	913	843	1121	691	878

It appears from this Table that fever declined, while there was increased prevalence of measles and whooping-cough. In his Report for June on the health of Glasgow, Dr. Gairdner notifies the same facts in reference to these diseases in that city.

The registrars report the fatal prevalence of measles at Croydon, Ampthill, Bristol and Clifton, Coventry, Leicester, Retford, Carlton, Nottingham, Derby, Stockport, West Derby, Preston, Bradford, Sheffield, and other parts. Scarlatina abounded and produced fatal effects in Birmingham, Stockton, Sunderland, Tynemouth, and other towns in the northern counties.

The rate of mortality in England in the last quarter was 2·041 per cent. against an average of 2·220. This is the lowest death-rate that has occurred in the spring season within the 30 years experience of national registration. The influence of the fine weather on health appears to have been more decidedly favourable in country than in town; for the death-rate in the chief towns was 2·22 per cent. against an average of 2·35; while in the small towns and rural districts it was 1·80, the average being 2·06. The mortality of Manchester was 2·77; that of Sheffield 2·63; and of Liverpool 2·58 per cent. In Birmingham the rate was 2·07, and was rather lower than that of London.

Third Quarter.—July, August, September.

The United Kingdom.—The Registers of the United Kingdom show that the births of 255,338 children and the deaths of 165,744 persons of both sexes, were registered in the three months ending on September 30th. The recorded natural increase was 89,594; the native emigrants were 40,672.

The number of persons married in the quarter ending September 30th, 1868, was 106,758.

The death-rate of the United Kingdom differs little from that prevailing in England and Wales.

The several facts concerning the other parts of the Kingdom are set forth in the quarterly reports of the Registrar General of Scotland and the Registrar General of Ireland.

The resident population of the United Kingdom in the middle of 1868 is estimated at 30,369,845; that of England and Wales amounting to 21,649,377, of Scotland to 3,188,125, and of Ireland to 5,532,343. The corrected death-rate of the quarter is 2·36 per cent.; the birth-rate is 3·53; the marriage-rate for the previous quarter 1·56.

England.—Marriages were less frequent than usual in the summer quarter of the year. The summer births have been above the average number. The deaths in the summer quarter too were in excess; and this

may be primarily referred to the heat of the season, or to the dearth of water. The heat was for several days tropical, and the sun struck a few, and injured many people. The high temperature gave activity in air and water to the lower forms of life, and consequently to the zymotic elements of diarrhœa, summer cholera, and scarlatina.

Marriages.—87,120 persons were married in the quarter that ended on September 30th; and the marriage rate was 1·592 per cent. on the population, slightly, therefore, below the average. The depression is considerable in London, but in several of the agricultural counties the marriages have increased. In Cornwall, Stafford, Warwick, Lancashire, the West Riding of Yorkshire, and in Monmouthshire, that is, in some of the mineral and manufacturing districts of the kingdom, the marriages have declined. In Brighton, Southampton, Bath, and Clifton, marriages declined; in Cheltenham they increased.

Births.—192,583 births were registered in the three months that ended on September 30th; and the birth-rate, 3·525, is the highest on record in this country. The augmentation is general, and throughout the summer, children have everywhere been born in unusual numbers.

The birth-rate in the great towns was lowest in Bristol 3·35, and Hull 3·340; highest in Sheffield 3·84, and Leeds 3·82.

Increase of Population.—The births exceeded the deaths by 62,101, which represent the natural increase of the population.

52,625 persons emigrated from the Ports of the United Kingdom at which there are Government emigration officers. 19,998 were of English, 4990 of Scotch, and 15,684 of Irish origin; while 11,953 were foreigners. What deserves remark is the diminished Irish emigration. Of the English emigrants, 14,189 sailed to the United States of America, 2691 to British North America, 2275 to the Australian Colonies, and 843 to other places.

The increase of the population of England proper was at the rate of 675, reduced by 217 emigrants to 458 daily.

Prices, Pauperism, and the Weather.—The average price of wheat was 59*s.* 1*d.* a quarter, to which it fell from 71*s.* 10*d.* in the quarter that ended in June. Beef by the carcase was $5\frac{5}{8}d.$ a pound; the lower quality being $4\frac{1}{2}d.$, the higher quality $6\frac{3}{4}d.$ a pound. The price has fallen a halfpenny a pound since the summer of 1866. The fall in the price of mutton in the same period was a penny, and for the higher qualities three halfpence a pound. The average price was $5\frac{3}{4}d.$ a pound, or for the higher qualities of mutton $6\frac{3}{4}d.$ a pound.

The best potatoes were 147*s.* 6*d.* a ton at the Waterside Market, Southwark. The price of this necessary of life was more than 50 per cent. higher than the price in the summer of 1866.

The mean temperature of the air at Greenwich for the three months was 63°·9; the mean temperature of the water in the Thames was 64°·9. Air, water, and earth, as well as their living inhabitants were exposed to heat several degrees above the average. On the 22d day of July the thermometer in the shade rose to 96°·6, the highest temperature of the air ever recorded at Greenwich. The whole year through, the temperature fluctuated round a line, sustained 3° above the average, by some law which meteorology has not yet brought to light. The winds blew at the rate of ten miles an hour; fogs prevailed on parts of 47 days; several thunderstorms broke over the face of the country in July and August; and remarkable falls of rain occurred on twenty days, but the fall in the aggregate was only 5·1 inches, whereas the average summer fall at Greenwich is 7·6 inches. The mean summer fall of rain is 767 tons to an acre of land, so in the last summer the deficiency was 252 tons an acre.

The year opened with a deluge of 4·2 inches of rain in January; in February and March there was a deficiency; in April the deficiency was made up to some extent; and on the four months taken together

there was an excess of 2 inches; then the usual showers fell scantily in May, in June especially, and in July. August saw its usual rain, but in September the supply fell to half the normal amount. The mean rain-fall of nine months is 18·5 inches, in the nine months of this year it was 16·0 inches, and a deficiency of water was the result.

Water is required by the population of the country for drink and for domestic purposes every day; now as rain falls at intervals it is evident that the constant supply can only be secured by natural, or by artificial storage of the water in rivers, lakes, ponds, under or above ground. At present many of these water reservoirs fall off, or fail altogether, after a certain number of days of drought; and the water supplied is limited in quantity, and often deteriorated in quality, for the constant undiluted impurities become more and more noxious every day to man and beast.

The first lesson of the season is the urgency of providing ample storage for the flood waters about the river heads, and for the rain-fall on houses, so as to equalize the distribution over the days of the year. The second lesson is the necessity of measures for the removal and interment of every kind of fermenting impurity. The diarrhœas, choleras, and analogous diseases, which spoil the enjoyment of the finest summers, will then be as rare in those days as the early migrating birds; for, finding nothing to feed upon, they will infest our cities and villages no longer.

The average number of paupers during the summer quarter was 917,833; of whom 138,794 were relieved in the workhouse, 779,039 out of doors. The number exceeded by 44,018 the previous summer average.

Deaths; and the State of the Public Health.—130,482 persons died in England during the quarter, and the annual rate of mortality for that term was 2·388 per cent. This exceeds the summer average of 2·024 by ·364 per cent. The average deaths would have numbered 109,544, and the actual deaths were 130,482, or 20,938 in excess.

Fortunately the previous half year had been so favourable to life, that the average mortality of the year to the end of September, with this excess, was below the average of the three seasons; but the gains of winter and spring were sacrificed by the fatality of summer.

Town and country always suffer in very different proportions, for the annual summer average of the country parishes is 17, of the chief town districts 22 to 1000 living. In the last summer these proportions rose to 20 and 26 respectively.

The mortality of some of the great towns was excessively high; in Manchester 38, Salford 36, Leeds 33, Sheffield 33, Liverpool 32, Bradford 31, Hull 30, Birmingham 30, Newcastle-upon-Tyne 27, London 25, Bristol 22. Thus if the country rate put at 20, allowing 3 for the excess due to the intense heat operating on the fermenting impurities of farms and cottages, be taken as the standard, and applied to the great towns, the human sacrifices of life were at the extraordinary annual rates of 2 in Bristol, 5 in London, 7 in Newcastle-upon-Tyne, 10 in Birmingham, 10 in Hull, 11 in Bradford, 12 in Liverpool, 13 in Sheffield, 13 in Leeds, 16 in Salford, and 18 in Manchester. It may be some years before these towns can be recovered from the fatal condition in which their populations are plunged; but no time should be lost; the works that have been commenced by the authorities should everywhere be accelerated, and then in a few years the good effects of improvements would be visible.

Among the districts including towns of smaller magnitude, the following are conspicuous for their summer insalubrity; Portsmouth (annual rate of summer mortality per 1000) 27, Southampton 26, Northampton 28, Yarmouth 34, Norwich 27, Stoke-upon-Trent 29, Wolverhampton 33, Walsall 39, Leicester 35, Nottingham 37, Derby 33, Stockport 34, Macclesfield 30, Wigan 39, Bolton 29, Bury 25, Ashton-under-Lyne 27, Rochdale 27, Preston 33, Halifax 31, Sunderland 27, South Shields 31, Gateshead 31, and Tynemouth 26.

Cardiff, Merthyr Tydfil, and Swansea deserve to be signalized for their low rates of mortality. They have Health Officers.

Summer cholera prevailed with considerable severity in London, where 267 deaths were ascribed in 13 weeks to this cause. The cases were published in the Weekly Tables in the terms employed by the medical attendants; such as cholera, cholera infantum, choleraic diarrhœa, English cholera, and in a few cases Asiatic cholera. A few individual cases were of short duration in adults, and were probably undistinguishable in their symptoms from many cases in the epidemic of Asiatic cholera, as it prevailed in the year 1866; but the character of the cases as they generally occurred, the diarrhœa, the coincidence of an excessively high temperature, and the general course of the epidemic, left no room to doubt that it was the common summer cholera of Europe. The late Spanish Government, however, chose under this pretext to subject vessels from the United Kingdom to quarantine on and after July 22d, and it does not appear that the restrictions were taken off before the Spanish Government itself had been removed.*

3145 deaths from diarrhœa occurred this summer in London, while the deaths from diarrhœa in the two preceding summers were 2186 in 1867, and 2298 in 1866, when cholera was epidemic. It is probable, as formerly several types of disease were confounded under the name of fever, so it may be now with diarrhœas; some of which may be the result of cholera matter bearing the same relation to the Asiatic matter as cowpock bears to varioloid lymph.

Fatal as diarrhœa was in London, it was much more fatal in all the other large towns. Thus 821 deaths from diarrhœa were returned in the borough of Birmingham with a population of 352,296; at the high London rate the deaths would not exceed 350. In Liverpool the deaths from diarrhœa were 859, Manchester 869, Salford 279, Sheffield 407, Leeds 566, Bristol 157, Bradford 205, Hull 226, Newcastle-upon-Tyne 122, Leicester district 330, Nottingham district 165.

The deaths from diarrhœa in Leicester at the high London rate would have been but 90; so that in that district there must exist conditions exceptionably favourable to the diffusion of diarrhœa.

Liverpool, Birkenhead, Manchester, Salford, Leeds, and Bristol have now Health Officers, and they, with the Health Officers of London, will, we may hope, have all the assistance they require, to enable them to investigate the course, and remove the flagrant causes of a malady which is so fatal to the population.

Fourth Quarter.—October, November, December.

The United Kingdom.—In the United Kingdom the births of 253,433 children, and the deaths of 158,742 persons of both sexes, were registered in the three months ending on December 31st. The recorded natural increase was 94,691; the native emigrants were 23,872.

The number of persons married in the quarter ending December 31st, 1868, was 127,058.

The death-rate of the Kingdom differs little from that prevailing in England and Wales.

The resident population of the Kingdom in the middle of 1868 is estimated at 30,369,845; that of England and Wales amounting to 21,649,377, of Scotland to 3,188,125, and of Ireland to 5,532,343. The corrected

---

* A decree inserted on September 1st in the Madrid Gazette contained this passage:—"Vessels coming from the ports of England will for the present be subjected to three "days quarantine of observation, provided that their bills of health and the occurrences "on board during the voyage do not excite suspicion." London Gazette, September 11th.

Queen Isabella left Spain on September 30th; on October 14th the Junta of Malaga ordered all quarantines to be taken off. London Gazette, October 16th.

death-rate of the quarter is 2·20 per cent.; the birth-rate is 3·51; the marriage-rate for the previous quarter 1·48.

The several facts concerning Scotland and Ireland are recorded in the quarterly reports of the Registrars General of those parts of the Kingdom.

England.—This Return comprises the Births and Deaths registered by 2202 Registrars in all the districts of England during the quarter that ended on December 31st, 1868; and the Marriages in 13,094 churches or chapels, about 5944 registered places of worship unconnected with the Established Church, and 640 Superintendent Registrars' offices.

The weather of the last quarter of the year was in many respects exceptional; no severe frost cut off the aged; and the prices of the necessaries of life fell to their usual standard. The birth-rate increased, and was much above the average, while the mortality was near, but below the average of the season. The English race is multiplying at an unabated velocity, and peopling the world.

Scarlet fever has been epidemical in many parts of the country, where it has proved a fatal scourge.

Marriages.—Marriages are always more numerous in the three months of October, November, and December, than in any of the three preceding quarters of the year. In the last quarter of 1868, 102,786 persons were married, against 106,076 in the corresponding period of 1867. The marriage-rate in the quarter under review was in the very low proportion of 18·76 per 1000 of population per annum, against an average rate of 19·89. It must be inferred, therefore, that the prospects of the working classes, according to their own view, were less bright.

Each of the eleven great divisions of England contributed more or less to the deficiency in the number of marriages in the quarter as compared with the corresponding quarters of 1866 and 1867, except the Northern, where the causes which operated to depress marriage did not prevail. In most of the manufacturing districts the depression of trade sensibly affected the marriage returns.

London exhibits a marked decrease, the number of marriages in the last three autumn quarters having been 9103, 8527, and 8168. In Lancashire the respective numbers were 7464, 6968, and 6721; in Liverpool 1029, 910, and 879; and in the capital of the manufacturing industries of England the numbers were 1295, 1201, and 1180 respectively. Among other districts of Lancashire, in which a considerable decrease is observed, are West Derby, Ashton, Oldham, and Preston.

In York district the marriages in the three autumn quarters of 1866–8 were 208, 196, and 142.

In South Wales the marriages successively declined from 2012 and 1935 to 1824.

Births.—The births of 192,852 children were registered in the last quarter of the year 1868; it is the greatest number that has ever been recorded in England in any autumn quarter. It exceeds by 9708 the births in the autumn quarter of the previous year. The birth rate on the population was 3·521 per cent.; the decennial average of the quarter being 3·347. Thus the registered births increased much more rapidly than the population. In the East and the North the increase was most conspicuous.

Increase of Population.—The natural increase of population is 71,398; this is the excess of births over deaths in 92 days; the daily increase is therefore 776.

Emigration carried off in the 92 days 11,302 emigrants of English origin; or on an average 123 daily. After deducting this number from the natural increase, the daily increase becomes 653. The emigrants of Scottish origin were 2902, of Irish origin 9668; thus the emigration in

proportion to population is still greatest in Ireland, least in England; while Scotland, ahead of England, approximates to Ireland. The English emigrants go to the United States, to British North America, and to the Australian Colonies. They constitute more than half of the Australian contingent.

Prices, Pauperism, and the Weather.—The average price of wheat fell from 67*s.* 11*d.* in the autumn of 1867 to 51*s.* 11*d.* in the last 13 weeks of 1868, and had the price of bread fallen in the same proportion, it would have fallen in the proportion of 8*d.* to 6*d.* The best beef, 7*d.* a lb., was a farthing a lb. dearer than it was at the end of 1867, while the price of inferior beef was stationary at 4½*d.* a lb. Inferior mutton remained at 4½*d.*: superior mutton was 6¾*d.* a lb., as well as beef also, a farthing a lb. dearer than it was at the close of 1867. Potatoes, which were dear in the summer, fell to 70*s.* and 140*s.* a ton, according to their quality. The wholesale price at Waterside Market, Southwark, was 3*s.* 6*d.* and 7*s.* a hundred weight.

The average number of paupers in the receipt of in-door and out-door relief, respectively, on the last day of each week in the quarter, according to returns furnished by the Poor Law Board, was 152,747 and 795,761.

The weather presented many peculiarities. In the ordinary run of years the temperature after summer declines rapidly through the three last months of the year, at the mean rate of about a degree every six days. In the last three months of the year 1868 the mean temperature of the air fell, it is true, from 47·9° in October, to 41·5° in November; but in December this was reversed, and the mean temperature of the Christmas month was 46·0°. The October and November months were colder than their departed brethren of past years, the December was warmer both by day and night. The barometer was low in December; the air contained more vapor, was less stable, and was lighter than usual; the rain-fall was excessive; the wind blew with unusual velocity at the rate of 17 miles an hour; violent gales were experienced towards the close of the month, and pressures of wind were recorded of 30 lbs. on the square foot.

The swallows departed from Eastbourne, on the south coast, on October 6th, and lingered at Osborne, in the Isle of Wight, until November 12th, at Holkham, on the east coast, until November 11th. Woodcocks continued to arrive between October 6th and November 5th.

Deaths; and the State of the Public Health.—120,454 deaths were registered in the last 92 days of the year 1868. The number is less by 10,028 than the numbers in the 92 days of the summer preceding, but exceeds the deaths in the corresponding days of the two previous years.

The annual rate of mortality was 2·199 per cent. per annum, which is a little below the average of the corresponding dates of the ten previous years.

The rate of mortality in the large town districts was 2·42, in the country districts 1·90; in both cases, but chiefly in the towns, below the average.

The number of persons to *ten* acres in town districts was 37·70, in the country districts 2·74; thus the town districts were nearly 14 times as densely peopled as the country districts; the mortality ranging from 2·42 for the towns to 1·90. The mortality rose with the density, but not in the same ratio; without the sanitary arrangements existing in towns it is probable that the mortality would increase with the density in a much greater ratio; and evidently if proper precautions were taken the effects of crowding would be still less remarkable. The 14 great cities and towns of the kingdom, peopled by 6,441,525 inhabitants, experienced a rate of mortality equal to 2·62; and this we know exceeds the rate in the least unhealthy districts of the kingdom by one half, as there the mortality does not exceed 1·70 per cent.

While the average mortality in the 14 great towns was at the annual rate of 26 deaths in 1000 living, it was 21 in Bristol, 21 in Birmingham, 25 in London, 29 in Liverpool, 31 in Manchester, 33 in Salford, 28 in Bradford, 32 in Leeds, 29 in Edinburgh, 33 in Glasgow. When will the north undertake the noble work of saving the lives of the people? Why should industrious, prosperous, and wealthy communities see their people perish year after year at these appalling rates, without trying some radical and effectual measures of reform? This is not a question of mere opinion, but of life and death; it is not a question of the day only, but of all time. Shall the town breeds of the north degenerate and die out, or improve and live? There appear to be disputes as to the particular measures to be adopted; why should not experiments be at once made in various blocks of houses? The water supply is an excellent preliminary, but the sewers must follow. The refuse must be day by day removed from the dwellings, and this the householder cannot himself accomplish in large towns. It is municipal work.

Many places in the south of England have suffered severely from scarlet fever. At Polstead, in Suffolk, 5 children out of a family of 6 died of diphtheria within 18 days. Scarlet fever was particularly fatal in Oswestry, Burslem, Wolverhampton, Sedgeley (Dudley), Carlton (Worksop), Mans-

field, Basford, and Derby. The mortality in Derby was at the rate of 30 in 1000, in Stockport 29, and chiefly from this cause. The Lancashire districts and the Yorkshire districts suffered severely from scarlet fever. It would be satisfactory to learn that the precautions adopted in Bristol have been carried out in all these great towns. At Dairycoates, near Hull, great complaint is made of an open sewer belonging to the North-eastern Railway Company. In the sub-district of Easington, Durham, 134 deaths from scarlet fever were registered. In Cockermouth 13 deaths from scarlet fever are recorded, in Maryport 35.

Some general measure for dealing with this and other allied, self-propagating zymotic diseases is required. Dr. Ballard, Dr. Druitt, and Dr. Budd have suggested measures well worthy of consideration.

In November, a vessel full of German emigrants put into Plymouth much disabled; during her short detention 13 deaths occurred on board, 5 of them from enteric fever. When will Germany adopt measures to secure her emigrants against the evils which have been to some extent corrected by legislation in England?

Note.—The above mortality for the *year* 1868 is the mean of the quarterly rates.

Remarks on the Meteorology of 1868. By James Glaisher, Esq., F.R.S., &c., *Secretary of the Meteorological Society.*

The year 1868 will be recorded in the annals of meteorology, as one of the most remarkable with respect to long continuance of high temperature, to the unusual distribution of rain, and to the early season of vegetation generally. Besides the extraordinary heat, the year was remarkable for the small number of thunder and hail storms, usually the accompaniment of great heat; also for the heavy falls of rain in the months of January and December, and very small amounts in all the other parts of the year, excepting April, as well as for the unusual prevalence of the west wind. The annual means of the several elements, at the several stations between Guernsey and Culloden, are shown in the following Table :—

Table **47.—Mean Annual Value** of **Meteorological Elements**

The results as shown in Table 44 are so uniform at all stations, that the discussion of the observations made at any one place bear a value which would not otherwise exist if this uniformity did not prevail. I therefore think it likely that the leading particulars shown from the daily observations at the Royal Observatory, will be applicable generally over the country, so far as excess or deficiency above or below the average, as applied to the character of the year.

Temperature.—At Greenwich the year 1868 was ushered in with cold weather, which lasted till the 11th of January, the wind being generally from the N.E. On the 12th day a change was experienced, the wind veered to the S.W., and the temperature increased and passed above the average, and continued so for the most part till the end of September. From the end of September to the beginning of December (with the exception of the first week in November) the mean daily temperature was

almost constantly below the average. From the beginning of December to the end of the year the mean daily temperature greatly exceeded the average.

Atmospheric pressure.—During the month of January the readings of the barometer fluctuated considerably, the falls in the readings being accompanied by violent gales of wind. In February the readings were generally high, but from the 27th of this month to the 12th of March the readings were below the average, on the latter day a change occurred, and the readings were almost constantly above the average till the end of July. From the 1st to the 24th of August the readings were generally in defect of the average. The readings were high from the 25th of August to the 6th of September, and from the 11th of the latter month to the end of November the readings alternated above and below the average. During

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's up to 1859.

the month of December the readings were with one exception below the average, this depression being accompanied by very violent gales, and continued till the end of the year.

Rainfall.—The months of January and December were distinguished for the great amount of rain which fell in each month, December being also remarkable for the continuance of wet weather. In February and March the falls were below the average. In April it was slightly in excess; in May, June, and July greatly in defect, especially in the two latter months, when the deficiency amounted to 1·5 in. and 1·3 in. respectively. In August it was slightly in excess; but the falls in the three following months were all below the averages. December as mentioned above was very wet, and the rainfall is the largest in amount that has been recorded in that month during the last 54 years.

Health of London in 1868.

London is still growing greater. Its population has not been counted for seven years, but it is probably 3,126,635. The estimated increase since 1867 is 44,263. The births registered exceeded the deaths by 40,836. The constant flow of strangers into London exceeds the outflow of its children to all the parts of the empire.

The central population varies night and day, as great numbers who transact business in offices, shops, and factories by day sleep outside the metropolitan bounds. The Metropolitan Police district, stretching in every direction about 15 miles round Charing Cross, is inhabited by about 3,637,040 people.

The area of London is 122 square miles, equal to a square of a little more than 11 miles, 18 kilometres, to the side. The Thames and the tides unite the great city to the sea. The ground rises to an elevation higher than the hills of ancient Rome, but a considerable part of the population on the south side of the river is living below or at the level of the Trinity high-water mark. The average elevation of the ground at which the population lives is 12 metres (=13 yards). The points below high-water mark on the north side of the Thames are in Fulham, Pimlico, Westminster, and the Isle of Dogs; on the south side in Battersea, Kennington, Camberwell, Bermondsey, and Rotherhithe. The Plumstead marsh has the lowest surface, from 5 to 11 feet *below* high-water mark. The highest elevations are at Hampstead (429 feet = 131 metres) in the north, and Shooters Hill (411 feet) and Sydenham Hill (360 feet) in the south. The site of the capital of the empire is an eliptical river basin round the dome of St. Paul's cathedral. The population is unequally distributed, dense

* For the years 1849–59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer.

in the centre, less dense in the outside districts. The mean density is expressed by nearly 100 people living to a hectare, 40 to an acre ;* the population density of the capital is 100 times the density of the United Kingdom. The people live in 400,778 houses ; the streets are irregular and often narrow, but the elevation of the houses is not often so lofty as to cover the streets with unhealthy shadows. The annual value under county rate assessment exceeded 15,000,000*l.*

Eight companies supplied the population with water, the life-blood of cities, from the Thames, and from its tributary the Lea, supplemented by wells. Their supply to London and its environs, according to the returns of the companies, amounted to 453,857 cubic metres daily, making a ton to every house inhabited or uninhabited: correcting for the supplies to factories and to streets, the domestic supply is equivalent to 12 decalitres† (26 gallons) daily to each person. The water drawn from the wells of London is now inconsiderable in quantity. Dr. Frankland's careful analyses show the composition of the waters. The Thames, unlike the yellow Tiber and the turbid Arno rushing down from the Appenines, is justly called "clear" in ordinary seasons, but it overflows, and its basin was heavily flooded during winter all down its lowest levels. Drought followed in summer, hence the composition of its waters varied largely.

The manure of fields, with the sewage of cities, was washed into the waters. On 60 trials, *five* in each month, the water was clear in 35 instances, slightly turbid in 10, turbid in 8, and very turbid in 7 instances, when drawn from the pipes of the five Thames companies. It deserves note, that the waters of the West Middlesex company were in all the 12 trials found clear and transparent ; and that the New River water was only twice found slightly turbid. The matters rendering the waters turbid are in suspension. Dr. Frankland's analyses deal with the matter in solution. He found the solid impurity dissolved in the Thames water ranged from 23 to 39 parts in 100,000, in the Lea water from 21 to 36 parts. In the summer months the waters attained an unusual degree of purity. Upon Dr. Frankland's scale the sewage contamination was much less in 1868 than in 1867 ; the West Middlesex and the East London companies both stood well.

The mean air temperature of the year was 10·9° centigrade,‡ or 1·7° above the average (9·2°). The mean temperature in Fahrenheit degrees

* A square of 100 metres to the side is the area of the hectare, of which an acre is a little more than four-tenths. A metre is nearly 1-tenth longer than a yard ; and 1 yard = 0·914 metres.

† The decalitre is a double gallon and a tenth more.

‡ NOTE.—The Centigrade graduation has many advantages over that of Fahrenheit: (1) Its zero 0° is at the freezing point of water; (2) its 100° is the boiling point of water. Degrees below *zero* are degrees of cold, and are preceded by the *minus* sign ; thus −·3° may be read 3 degrees of cold, or 3 degrees below zero. The zero of Fahrenheit is 32° below the freezing-point of water ; 212° mark the temperature of boiling water.

was 51·6°; the highest temperature in the shade 96·6°. The highest temperature, 36° centigrade (nearly blood-heat), at Greenwich was attained in the latter part of July. The air was unusually dry. Yet the great rains at the beginning and the end of the year raised the rain-fall to 64 centimetres (25·28 inches), which is nearly the average for Greenwich. The wind moved at a mean velocity of 20 kilometres (12·2 miles) an hour, the average being 17 kilometres (10·3 miles) an hour.

The sewerage of London is approaching completion. Three great sewers north of the Thames converge at Abbey Mills, near the east loop of the Lea: the northern high level sewer flows from the foot of Hampstead, through Stoke Newington and Hackney; the middle level sewer runs from Notting Hill, down Oxford-street, by Bishopsgate station and Victoria Park to join the high level sewer west of Old Ford; the western sewer runs from Chiswick by Chelsea Hospital to a point at which its contents will be lifted into the northern low level sewer, to take up all the drainage of Westminster and the City, and Limehouse, Bromley and Poplar, and carry it to the Abbey Mills, where its contents are to be lifted by pumping into the northern outfall sewer, which will carry the three united streams of sewage down to the reservoir at Barking Creek. The most important parts of the low level sewer are not yet constructed; namely, the part from Chelsea Hospital, including the first lift down to Westminster Bridge, and the part extending from the Temple to the Tower of London; so that many of the large sewers still pour their contents into the Thames. The three southern sewers converge at Deptford, and after the lower stream has been lifted, flow down the southern main outfall sewer to Crossness. These sewers, north and south, have already produced excellent effects. They are sufficient to carry off the rain-fall in the common year, except on about 12 days, when the sewage flood is thrown bodily into the Thames through overflow weirs. The river in London is much less offensive than it was, as may be inferred from the fact that about 360,000 cubic metres of sewage are carried down to the reservoirs of Barking and Crossness, where they are pumped into the stream, when the tide is flowing out. For an ample account of this great and important work, see the Report of Mr. Bazalgette on the main drainage, and the reports of the Metropolitan Board of Works.

When the northern lower level sewer is completed, and the branches of all the sewers are in safe communication with the houses, when the sewers are well cleansed and ventilated, and when the sewage is utilized, this system of treatment will be in full operation, and the weekly returns will test its efficacy.

is Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year.

The houses inhabited, it has been seen, are about 400,778 in number, each occupied by about 8 people, 7·8; by nearly twice an average family (4·4). The water supply is not on every house, it is intermittent, and the water not always pure, is never soft; the air is often charged with smoke; and the sewage is not entirely removed from all the dwellings.

The food supply is the other great element affecting the public health: respecting its amount in meat, bread, vegetables, and its distribution, which is of still more importance, the information is at present defective.

The weekly returns are for 53 weeks, when the deaths amounted to 74,908. After correcting for this and other disturbing elements, the mortality is found to be at the annual rate of 23·59, or nearly 24 deaths to 1000 of the population. This is below the average mortality of 24·34. The improvement is most striking in south London, where the sewage stagnated, and the water supply was drawn directly from the Thames, charged with sewage down to the year 1856. The mortality there was at the rate of 38 and 35 per 1000 in the years 1849 and 1854; during the average of five years 1840–44 it was 25, of five years 1845–49 it was 28, and during the five years 1850–54 it was 26; in 1855–59 it fell to 23; in 1860–64 it was 23; and in 1865–68 it ranged from 22 to 24; in the last year it was 23. The mortality is now lower in south London than it is in north London.

Diarrhœa was unusually fatal, 4060 deaths in the summer, and 320 deaths by simple cholera were registered. The other fatal zymotic diseases in the 53 weeks were fever 2483 deaths, scarlatina 2921 deaths, whooping-cough 2369, measles 1989.

Average Number living to One Death annually (1840-68) . . .	41	44	44	40	38	40

NOTE.—The Annual Rate of Mortality in this Table is deduced from the Population at the Censuses of 1841, 1851, and 1861, and from the Deaths registered in London in each of the several years.

The Mortality for LONDON in each year, 1840-68 is calculated on the Deaths for the complete years, instead of for 52 or 53 weeks.

TABLE 59.—RETURN of the NUMBER, AGES, RATINGS, and CAUSES of DEATHS of SEAMEN reported to the REGISTRAR GENERAL of SEAMEN as having died in the BRITISH MERCHANT SERVICE in the year 1868.

Class I.

ORDER I.	Deaths.
Small-pox	15
Measles	1
Quinsy (included with diseases of Respiratory Organs, Class III., Order III.)	
Fever	340
Erysipelas (included with diseases of Integumentary System, Class III., Order VIII.)	
Dysentery	216
Diarrhœa	100
Cholera	175
Ague	34
Yellow fever	155
Rheumatism	11

ORDER II.	
Syphilis	(included with diseases of Urinary Organs, Class III., Order V.)
Stricture of Urethra	

ORDER III.	
Purpura and Scurvy	26

Class II.

ORDER II.	
Phthisis	171

Class III.

ORDER I.	
Cephalitis	116
Apoplexy	
Paralysis	
Insanity	
Epilepsy	
Convulsions	
Brain disease, &c.	

ORDER II.	
Pericarditis	108
Aneurism	
Heart disease, &c.	

ORDER III.	Deaths.
Laryngitis	83
Bronchitis	
Pleurisy	
Pneumonia	
Asthma	
Lung disease, &c.	

ORDER V.	
Nephritis	36
Ischuria	
Bright's disease (Nephria)	
Calculus (Stone)	
Cystitis	
Kidney disease, &c.	

ORDER VIII.	
Phlegmon	18
Ulcer	
Skin disease, &c.	

Class V.

ORDER I.

(ACCIDENT OR NEGLIGENCE.)

Drowning—by accident	1,141
Drowning—by wreck	1,785
Other accidental deaths	281

ORDER III.

(HOMICIDE.)

Murder and Manslaughter	16

ORDER IV.

(SUICIDE.)

Means not stated	23
TOTAL specified Causes	4,851
Causes not specified	386
TOTAL	5,237

RATING.

Mates	409	Surgeons	12	Firemen	143
Midshipmen	3	Stewards	360	Stowaways	11
Quartermasters	10	Cooks		Unknown	925
Boatswains	125	Carpenters	131	TOTAL	5,237
Able seamen	1935	Sailmakers	33		
Ordinary seamen	567	Minor capacities	75		
Apprentices and boys	441	Engineers	57		

AGES.

Under 20 years	1,056	Over 60 years	17
20—30 years	2,111	Unknown	871
31—40 years	766	TOTAL	5,237
41—50 years	326		
51—60 years	90

1870 -	**31,232,013**	15,121,679	16,110,334

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, a certain proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers (1801–61) have been deduced by raising the enumerated population of the United Kingdom, including the islands in the British Seas, (*see* Table 9. p. 84. of Vol. III. Census of England and Wales, 1861,) up to the middle of the respective Census years. In 1866–1870 the numbers have been estimated by adding the population enumerated in the islands in the British Seas in 1861, and the number of men in the Army, Navy, and Merchant Service abroad, (*see* Tables 3. and 16. pp. 81. and 87. Vol. III. Census 1861,) to the population for 1866–70, returned in Table 60. pp. lxxiv–lxxv.]

he *Registration Counties* consist of groups of entire Regis- n Districts; which Districts are, in general, identical with or Law Unions. As the principle adopted has been to

County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1868.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 40 cases of marriage after divorce, viz., 16 *divorced men* who married spinsters, 2 *divorced men* who married widows, 17 bachelors who married *divorced women*, 4 widowers who married *divorced women*, and one *divorced man* who married a *divorced woman*. For the districts in which these marriages took place see subsequent pages.

ABSTRACT OF MARRIAGES.—Marriages registered in England, pursuant to the

STRATION COUNTIES.	Area in Statute Acres.	Population, 1861.	TOTAL MARRIAGES.	MARRIAGES. According to the Rites of the Established Church.						Not according to the Rites of the Established Church.					
				Special Licence.	Licence.	Banns.	Superintendent Registrar's Certificate.	Not stated.	TOTAL.	TOTAL.	In Registered Buildings. Roman Catholics.	In Registered Buildings. Other Christian Denominations.	Superintendent Registrar's Office.	Quakers.	Jews.

* The *Districts*, which are arranged according to their local position, are collections of contiguous Parishes or Places, generally identical with the Poor Law Unions of the same names.

† For the changes made on 1st July 1868 in the constitution of the Districts of Lambeth, Lewisham, Greenwich, Strand, Marylebone, Westminster St. James, and Woolwich, see page 172. In these tables the marriages in the district of St. Martin-in-the-Fields prior to 1st July 1868 have been added to the Strand district (13).

* In the other 58,328 cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor L Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in wh either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1868—*continued.*

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 640 in number, are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District. The smaller Institutions are not noticed.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83–4.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

§ For the changes made, on 1st July 1868, in the constitution of the Districts of Westminster St. James, Strand, Greenwich, and Lewisham *see* page 172. In these Tables the numbers of Births and Deaths are entered as if the alterations had taken effect on 1st January 1868.

* The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included; *H* indicates Hospital or Infirmary; and *L* Lunatic Asylum.

† For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

‡ Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated. The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

§ For the changes made on 1st July 1868 in the constitution of the Districts of Westminster St. James and Strand *see* page 172. In these Tables the numbers of Births and Deaths are entered as if the alterations had taken effect on 1st January 1868.

* For the changes made on 1st July 1868 in the constitution of the Districts of Greenwich and Lewisham consequent on the formation of the new District of Woolwich *see* page 172. In these Tables the numbers of Births and Deaths are given as if the alterations had taken effect on 1st January 1868.

† Greenwich Hospital and the Union Workhouse are situated in this Sub-district. For the number of Deaths in those institutions see Table pp. 83-4.

II.—SOUTH EASTERN COUNTIES.—BIRTHS AND DEATHS, 1868—SUB-DISTRICTS—*continued.*

No.	SUB-DISTRICTS.	Area in Statute Acres.	Population, 1861.	TOTAL BIRTHS.	TOTAL DEATHS.	BIRTHS. Including Illegitimate Births. Males.	BIRTHS. Including Illegitimate Births. Females.	BIRTHS. Illegitimate Births. Males.	BIRTHS. Illegitimate Births. Females.	DEATHS. Males.	DEATHS. Females.	Excess of Births over Deaths.

ONDON.—Number of Deaths in the different Classes of Public Institutions during the Year 1868.*

INSTITUTIONS.	Deaths in 1868.	Of the Total Deaths in London the Proportion per Cent. in Public Institutions.
LONDON.—Total Deaths in 120 Public Institutions	12,326	16·70
In 46 Workhouses (*a*)	6789	9·20
12 Prisons (*a*)	75	·10
4 Military and Naval Asylums	176	·24
16 General Hospitals (*a*)	3714	5·03
9 Hospitals for Special Diseases	933	1·26
4 Lying-in-Hospitals — Women	15	·02
4 Lying-in-Hospitals — Children	46	·06
7 Military and Naval Hospitals	163	·22
3 Hospitals and Asylums for Foreigners	79	·11
19 Lunatic Asylums (*a*)	336	·46

(*a*) In London, at the Census of 1861 (April 8th), the inmates of 45 Workhouses were 23,745, of the 12 Prisons 5,612, of 15 General Hospitals 3,123, and of 18 Lunatic Asylums 3,102. The officers of the institutions, their families, and the infant children of female prisoners, are not included in these numbers or in the number of deaths. One Workhouse (belonging to the Stepney Union, but situate in Poplar 25), the West London Hospital (in 1; 6), the North London Consumption Hospital (in 8; 1), and one Lunatic Asylum in Hackney, included in the Table, have been instituted since the Census of 1861.

Deaths in Public Institutions in each District of London during the Year 1868.

ENGLAND.—Supplementary Table of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

CAUSES of DEATH at different Periods of Life, in the Year 1868.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as chicken-pox, mumps, epistaxis, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

*Note.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in *hospitals* proportionally over every district. The second rate of mortality (in figures of different character) is the result of a further correction,—in Chelsea and Greenwich for the Military and Naval Hospitals, in Wandsworth for the County Lunatic Asylum, and in the other London Districts for Workhouses situated out of the Districts to which they belong.

In all the other Districts of England the second rate of mortality is the result of a correction for either a Naval or Military Hospital or Camp, a County Lunatic Asylum or a Workhouse situated out of the District to which it belongs. The particulars of these corrections are given in the Supplement to the 25th Report, pp. xl-lviii.

† For the changes made on 1st July 1868 in the constitution of the Districts of Westminster St. James, Strand, Greenwich, and Lewisham, as well as for the names of the parishes comprised within the new District of Woolwich, *see* page 172. In these Tables the Deaths are entered as if the alterations had taken effect on 1st January 1868.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1868, in the DISTRICTS of England—*continued.*

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND in 1868, by WILLIAM FARR, Esq., M.D., F.R.S., D.C.L. . . . 197–213

TABLES 214–234

APPENDIX A.

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1868.

Sir,

The mild winter of the year was congenial, and many people lived through it, who would have succumbed in severer weather. The heat of summer was intense, and at the same time that it filled and ripened the wheat ears, it led to the development of several fatal summer diseases. The high temperature itself was fatal to a certain number of persons; for four weeks of July and August, the mean temperature at Greenwich was 21° centigrade; the mean of the highest day temperatures 34°; and on Wednesday, July 22d, the extreme high temperature of 36° was attained. This is the highest temperature ever registered at Greenwich during the period of authentic record. The temperature only fell at night to 17°. The mean temperature of the day was 26°. The season was dry, and in many parts a scarcity of water was felt during the summer; but scarcity always implies the consumption of impure water, to which the population is driven by its wants. The exceptional year of high temperature in every month, except January, October, and November, gave a peculiar character to the prevailing diseases. The diseases of the respiratory organs lay almost dormant in winter; 223 persons died by sunstroke; and that vague, indefinite disease, diarrhœa, breaking out in the middle of June, grew every week more fatal, until it apparently reached its maximum in the week of July, when the temperature was highest. Cholera had been epidemic in 1866, and it showed signs of resuscitation. But the sources of its strength had been dried up, and it silently subsided as the year advanced.

Of 480,622 deaths, the causes were assigned more or less distinctly in 473,773 cases; leaving 2945 sudden deaths in which inquests were held, without discovery of the cause; and 3904 other cases of various kinds.

It is right to state, that in the great majority of cases the deaths were certified by the qualified medical attendants, while in Wales and certain parts of the country, where many people die without medical attendance, the causes were simply reported to the registrars by the informants.

I have discussed before the importance of getting the most accurate knowledge that can be obtained of the causes of death of the whole population, in the letter which you did me the honour to publish in the appendix to your 27th annual report. And I endeavoured to show how that inquiry, which is merely an extension and a necessary complement of the inquiry by the coroner, instituted in the earliest ages of our civilization, may be conducted in a sure and simple method, by means which the advanced science of the present day places at our disposal. Under this system every death in which no sufficient certificate was given would be inquired into by a competent officer, who might in many places combine with this duty any other public office, such as that of health officer or coroner. It is impossible to overrate the importance of this inquiry. It would detect crime, prevent crime; it would shield the helpless. It would bring to light the causes of diseases, and might prevent the frequent recurrence of several deaths in the same house. It would remove a blot from our system of registration; give value to

the registration certificate; lead to greater accuracy in the registration records; and increase the scientific value of your reports.

The Royal College of Physicians, London, has with the other medical bodies, from the first evinced its enlightened appreciation of the importance of this branch of registration, and a committee, convened by it, of which Sir Thomas Watson was president, Dr. Sibson was secretary, have prepared a nomenclature of diseases, which has been distributed to all the medical practitioners of the United Kingdom. It only remains now to secure the universal application of the improved system by adequate administrative arrangements.

In comparing the fatal diseases of successive years, it is necessary to bear in mind that the knowledge of medical observers is undergoing changes every year, and is becoming more precise as pathology advances. Thus, heart diseases are now recognized, affections of the urinary organs, and cancers, which some years ago, would have been overlooked, or have been confounded with other maladies. In such cases it is not safe to infer that these diseases which afflict mankind are really increasing, because the numbers which medical men distinguish are augmenting. The physician will know how to interpret the ambiguous facts, and to turn them to account.

It is the duty of physicians, in recording facts respecting disease and death, to employ the same care as astronomers and meteorologists bestow on the observation of physical phenomena, and if that is done the observations will admit of the same kind of generalizations. And it must be evident, that as far as progress is concerned, these direct observations on the death, and life, and reproduction of the human race are of fundamental importance. The processes are complicated; life is enshrouded by an almost divine mystery; death is a kind of darkness; but it is a darkness which science can illumine.

I.—Zymotic Diseases.

The zymotic class comprises many forms of malady which are apparently due to organic molecules generating, developing, reproducing themselves in the substance of the higher animals. Thus the lymph of small-pox in a child contains specific molecules—*variolads*, as they may be called, which inserted in the tissues of another child develop and multiply themselves as if they possessed an independent life, and may be incidentally fatal to the natural, molecular life of that other child. These diseases fluctuate from year to year; and some like cholera are modified by temperature. Their mortality depends largely upon sanitary conditions; and is due to coincidences between their activity and the previous state of susceptibility of the population, which is at a minimum immediately after the prevalence of an epidemic eruption.

Small-pox is largely under control, inasmuch as a vaccinated population enjoys the kind of immunity, which small-pox confers against future attacks. Thus the deaths from small-pox were 7684, and 6411 in the years 1864 and 1865, and only 2513 and 2052 in the years 1867 and 1868; when it is probable that an increased proportion of the children had been vaccinated. On an average of each five years from 1850 to 1864 the deaths by small-pox to 100,000 living were 28, 20, 19; in each of the four years 1865–8 the mortality by this disease was 31, 14, 12 and 10.

The mortality by measles, 54 in 100,000 was above the average; and so was scarlet fever 102; while the mortality by the new disease, diphtheria, was 14: croup and whooping-cough were below their average.

Fever, including typhus, typhia (enteric fever) and *typhinia* (relapsing fever), is one of our deadliest enemies; it slays not only many children but adults: 41 deaths in 1000 deaths are due to fever. The mortality by fever to 100,000 living in the year was at the rate of 92; the average rate for

the 19 years ending in 1868 was 92 ; the highest rate attained was 111 in the year 1865 ; the lowest rate was 66 in the year 1860. Upon looking over Table 6. (p. 216.) it will be seen that the mortality for the sexes varies : it is higher in females under the age of 25 ; and after that age it is higher in males than in females. To 91 deaths there are about 781 cases of fever, each disabling a man for a month, and leaving him after recovery weak. The necessity of watching this disease and combating its ravages by sanitary measures is evident from these bare facts.

The same lesson is enforced by the Tables showing the ravages of scarlet fever and diphtheria. The number of deaths shows no signs of decrease. They have both devastated especially the dirty dwellings of the mining population of Staffordshire and Durham ; the dense manufacturing districts of Lancashire, and the West Riding of Yorkshire ; and the close dirty streets of the metropolis. Few homes are spared altogether.

Erysipelas, like puerperal fever, is often engendered in hospitals, where it and pyæmia are fatal after surgical operations. The disease exhibits some evidences of decline, which may be fairly ascribed to the improved arrangements to secure ventilation and cleanliness. (See Tables 9 and 13.)

The diarrhœa of the year was fatal to 29,821 persons ; it has never before in any of the 17 years (1852–68) been so fatal. The water of the kingdom is in many towns more contaminated than it was formerly by the discharges of sewage into the rivers. The deaths by diarrhœa were at the rate on 100,000 living of 139 : the average for the 15 years 1850–64 was 80. Diarrhœa is a common name for what is often called a symptom : the loss of serous fluids from the blood by intestinal discharges. This flux can be induced under different forms by various drugs, such as sulphate of magnesia, rhubarb, colocynth, elaerium, blue pill, and calomel. Each drug produces a modified flux. Then when dysentery is epidemic it is accompanied by diarrhœa, and is not this diarrhœa a modified form of dysentery ? And so it is with Asiatic cholera. Surely these diarrhœas have in them some distinct features of which medicine should take account. Can no distinct character be perceived in the flux itself ? The causes are different. Treatment to be effectual should also not be the same. It is probable that by careful study "diarrhœa" may be found to cover diseases as distinct as "fever" under which typhus, enteric fever, and relapsing fever were so long confounded, until the sagacity of Dr. Jenner and other pathologists subjected the phenomena to careful analysis.

1498 deaths were ascribed to cholera ; and among them were many cases that could not have been distinguished from the Asiatic type.

The zymotic class, besides the misasmatic order of diseases, fatal to 111,106, contains three other orders much less fatal now in England, but in former ages both prevalent and destructive in some of their forms.

The enthetic order comprises syphilis, to which 1886 deaths were referred. Whether this disease is really becoming more fatal in England or not, it is impossible to say, as it is one of those diseases which it is believed have been suppressed in a considerable number of returns. If the suppression is now less than it was formerly, this will account for the increase from 1089 fatal cases in 1859, to 1886 fatal cases in 1868 ; otherwise we are driven to believe that the disease is growing every year more prevalent.

The twenty-two million inhabitants of England no longer suffer from the periodical famines which visited their forefathers when they numbered no more than a fifth part of the present population. This is due to the progress of agriculture and commerce—the ships, roads, and railways putting every county in communication with the whole world—and the poor law, imperfectly conceived as it is, still a kind of insurance against death by starvation. The deaths ascribed directly to privation in the

year are 96, and the numbers have ranged since 1852 from 3 to 5 in 1,000,000 inhabitants. It is true also that in a certain number of cases the fault lay with the victims themselves.

The deaths by intemperance exceeded the deaths ascribed to want: 20 in 1,000,000 in the year died of delirium tremens, and 16 of other forms of intemperance.

Thrush is the most fatal of the parasitic diseases; but 8 in 1,000,000 died of worms, hydatids, porrigo, scabies, and other forms of this order.

II.—Constitutional Diseases.

At the head of the diathetic order is gout, which can often be traced to dietetic excesses, either of foods or of drinks. Where muscular exercise does not carry off the load, the urates accumulate and are deposited about the joints. The disease is the especial appanage of man, for out of 393 deaths by gout recorded 316 were deaths of men, only 77 of women; and nearly all the deaths occur at the age of 35 and upwards. The greatest number of deaths by gout are at the age of 55 to 85. Dropsy is associated with many organic affections under which it is now more frequently entered than it was some years ago. Cancer is a disease most fatal to women: the reported deaths from it have increased almost every year since the returns have been made. This is perhaps due to the fact that cancers of internal organs, formerly overlooked, are now discovered.

The tubercular diseases, including consumption, are still exceedingly fatal, but the deaths under this score, on an average of years, are decreasing. Unfortunately the mortality by bronchitis, which in its chronic stage simulates phthisis, is increased to fully a corresponding extent.

III.—Local Diseases.

This is the largest, and most fatal of all the classes of causes: under it 178,634 deaths are recorded: the nervous system and the respiratory organs were the seats of nearly equal numbers of these fatal maladies, 60,174 and 63,103: while the deaths by diseases of the organs of circulation, and of the digestive organs, were little more than a third of those numbers, namely 22,558 and 21,479. The diseases of the urinary organs are chargeable with an increasing number of deaths, namely 6,872: the deaths referred to the other orders of the class are comparatively much less numerous.

IV.—Developmental Diseases.

These diseases incidental to the processes of reproduction, development, growth, and decay, begin with premature birth, itself often the consequences of affections of the mother, but generally of diseases of the child which thus asserts its autonomy. 8,757 premature births and deaths are recorded. Then follow malformations, where the formative process is at fault. Women succumb in childbirth by various kinds of diseases. There has been some tendency to suppress the mention of childbirth, and to record only secondary affections; but there is no reason to believe that the tendency is increasing. In 22 years 72,421 mothers have died of parturition; 23,689 by metria or puerperal fever, and 48,732 by the other accidents of childbirth. The mortality was at the rate of 49 to 10,000 children born alive; in the last two years it was 44. The recent discussions on the mortality of hospitals, in which Dr. Evory Kennedy of Dublin and Sir James Simpson of Edinburgh have taken a leading part, cannot fail to have a salutary effect.

Puerperal women are not exempt from other serious diseases to which they are liable to succumb: they are more vulnerable than other women,

for they are exposed to a double danger; as the loss of either life is almost always fatal to both.

26,050 deaths of persons of 65 years and upwards from old age were recorded. The subjective symptoms of disease are confused at these advanced ages; and as all the forces of life grow feeble, the alteration of the state of the various organs is not easily detected by observers. And many very old people die without adequate medical attendance. So that it is probable many of these deaths were the consequences of latent disease. The same remark applies to the fourth order including atrophy and debility.

In the Tables pp. 120–125, the deaths of the sexes at different ages are distinguished; and the supplementary Table pp. 126–129, also deserves study, as it contains the diseases of least frequent occurrence, but often on that account of considerable interest.

There the various ways in which childbirth proves fatal are described. Thus 107 women died of puerperal mania, 33 of them under 25 years of age; 95 died of phlegmasia dolens; 343 of puerperal convulsions; 510 of flooding; 141 of placenta prævia.

V.—Violent Deaths.

The causes are complex; but they are by the nature of the case in some way evident. I have analysed them in the statistical nosology, and have pointed out the facts to be recorded under various circumstances, so as to render the coroners' informations of practical use.

The Coroners Court is one of the old institutions of the country. And it had up to a recent period, like many other institutions, not kept pace with the times. The "crowner's quest" verdicts in the beginning of the reign of Queen Victoria were very much on a par with its "law" in the reign of Queen Elizabeth. Everything had fallen into hopeless routine; and the enigma of death was supposed to be solved by such formulas as "visitation of God," "natural death," "felo de se," "accident," and the like. In the Appendix to your third Report the subject was discussed in some detail.* Under the Registration Act the coroners were required to return the findings of the Juries to the Registrar; and all the verdicts thus for the first time came under review. They were not at all creditable to the intelligence of the country. They conveyed the least possible information, in the vaguest possible words. This was publicly represented. Instructions were drawn up, showing how the facts might be expressed in the simplest terms so as to serve the purposes of analysis, and to suggest measures for the removal of evils destructive to life. The Medical Witnesses Act of Mr. Wakley supplied better information in some cases. Dr. Lankester, and several of the coroners now bestow care in supplying the information required on a tolerably uniform plan. Still the information of many coroners is incomplete and unsatisfactory.

Thus in the year 38 persons are said to have been accidentally killed in mines; the kind of accident is not given. 415 males, 522 females are said to have died of burns; how this year's holocaust in England of 937 lives was offered up we are not informed by the coroners, or any other informant. Was it by clothes taking fire? Was it by the conflagration of a dwelling house? or by other agencies? The distinction is important. The means of preventing such deaths is very different in the various classes of cases. 447 males, 296 females died of scalds, in ways not distinctly stated. Then 558 males, 273 females are said to have died of "fracture," but by what means the fracture was induced, we are left in the dark. Numerous cases are still returned simply as murders, suicides, accidents, or injuries, without any information as to whether poison, or any other instrument was employed in the deed. 2752 per-

* Third Report, abstracts of 1839, pp. 75–97.

sons were returned as "drowned," of which 922 were returned as "found drowned," but whether the remaining 1830 lives were lost in bathing, by fall from ships, by shipwreck, by boats upsetting, by ice breaking, or by other means we know not. Whether the death was homicide or suicide, caused by negligence or accident—was left undetermined.

In some cases where lone men or women die in dwellings no inquests are held, and in consequence the deaths do not appear in the registers, as in those instances the coroner is the only possible legal informant. This is to be regretted; particularly as now the coroners being paid by annual salaries, and not having the same direct pecuniary interest in holding inquests as they had before the late act passed, they may be accused of a neglect of duty. When bodies are washed ashore, or are found exposed, the coroners are the legal informants; but as they often live at great distances from the registrar, it is difficult to obtain their signature, and some violent deaths may thus be missed. Again in the case of an explosion in a mine fatal to 100 or more people, the coroner, who is the legal informant, in each individual case, may only think it necessary to hold inquests on three or four bodies. The inquest, besides the loss of time to jurymen, costs, on an average 2*l.* 18*s.* 7*d.** It is thus an expensive inquiry to set in motion; and better informants on the spot where the death happens may be found in some such cases as those above noted.

To render the coroners every possible assistance in their difficult and important office, you addressed letters to them on the 10th August 1845†, and again on the 5th March 1868†. The effects of the latter will, it may be hoped, be visible in the year 1869: in the year 1868 we have seen how many deficiencies have to be deplored.

The facts, as they are returned, display so great a loss of life, as to cast all the deaths in modern battles, all the burnings of inquisitions, and all the proscriptions of imperial tyrants into the shade, as far as numbers of cruel deaths of men, women, and children are concerned. In the year, in England and Wales alone, 16,968 persons died by violence; in the five years preceding, the deaths by violence amounted to 83,853. Males are more exposed than females to the causes of these deaths, which were fatal to 12,833 males, and to 4135 females in this year: even under 5 years of age there is a difference; as 2,047 boys, 1,712 girls under 5 years of age died by violence. After that age 10,786 males, 2,423 females are killed.

Several new causes of violent death have sprung recently into operation. Thus 797 people were killed on railways; and 1,215 were killed in mines. Many men were poisoned by poisons unknown in the early ages. In modern manufactories many died of fatal accidents. Fire and gas on one side, and water on the other from the increase of navigation, have redoubled the danger from these useful friends, and redoutable enemies under different conditions.

At first sight it might appear that civilization had augmented more than it has diminished the dangers of mankind. But upon reflection it will be found that the dangers in past ages and in uncivilized countries, from wild beasts, from famine, from factious fights, and from destructive wars of races, must have been more fatal than the dangers by which they have been to a certain extent replaced. Even now it will be found that the numbers returned as killed by horse conveyances (1331) considerably exceed the deaths by railways. Still mechanical force, steam, and chemical agency are undoubtedly new elements of danger to mankind.

Dangers from all these new sources can be greatly diminished by judicious precautions and by wise laws. Each class of cases has to be considered by itself in seeking for remedies.

---

† *See* Seventh Annual Rep., pp. 315–316, and Twenty-ninth Annual Rep., pp. 198–204.

Railways.

The persons killed on railways amounted to 797; of the number 714 were males, 83 females. 34 of the persons, 21 males, 13 females were returned as killed by manslaughter; 33 out of the 34 were suffocated or burnt in the disaster at Abergele on the 21st August; 24 of the deaths, 21 of males, 3 of females were suicides: the unhappy victims threw themselves on the railways, and converted the trains into steam Juggernauts.

Taking all the 797 persons killed on railways: of 75, particulars are not given; 539 were run over on the line; 34 fell from the carriage or engine; 13 were killed by collisions; 94 by crushing; 7 by fall of heavy substances; 35 by burns.

This return differs largely from that made to the Board of Trade for the same year, of only 150 deaths in England and Wales.* The companies speak with confidence of the accuracy of their returns of passengers, 39 of whom they state were killed by causes beyond the passengers' own control, and 14 by causes referable to misconduct or want of caution. In the two previous years, 24 and 28 passengers were killed. The return of accidents to servants of companies and of contractors is said to be incomplete, because many railway companies are not required by law to report accidents to such persons to the Board of Trade. It is in this quarter that the return to the Board of Trade is most defective. It is probable that none of the railways return deaths occurring some weeks after the injury. The numbers "injured" by the English railways in 1867, as stated in the returns, was 660 to 138 deaths; in 1868, it was 528 to 150 deaths, or excluding the Abergele deaths, to 117 deaths.

Registration returns only 13 deaths by collision in 1868. In the five years 1863–7 only 82 persons were said to have been killed by collision, 31 by trains running off the line. That makes 23 deaths annually including engineers and stokers. It is probable, therefore, that the return by the companies of 105 passengers killed in three years (1866-8), or 35 annually, though understated, may serve as a basis of computation; and the number, as compared with the number of journeys, is not considerable. Thus in the year 1867, besides 84,418 season ticket holders, 250,598,982 passengers travelled by rail; and as 35 were killed on an average of the three years 1866–7–8 according to the returns, the chance of this disaster on the way to any one is represented by the fraction ·000,000,12, after correcting for season ticket holders. Hence it follows that a premium of 1-eighth of a farthing, will insure 1,000*l.* on an average journey; and taking 600 journeys a year ·072*l.* = 1*s.* 5*d.* will insure 1,000*l.* on any life killed during a year of average journeys. Then, as about 23 passengers are injured to one killed, by taking the duration of illness into account, we see how those ingenious persons who undertake insurance against railway accidents make their calculations and profits.†

The chances against being killed in any single journey vary with the line, and perhaps with the distance; but, if the return is correct, the general chance is more than 8,000,000 to *one* that a passenger will arrive at the end of the journey alive; and the chances are more than 362,000 to *one* against his being either injured or killed. It is probable that there is now no safer kind of locomotion than railway travelling. It is safer than riding on horseback, or in a carriage.

---

* Number of accidents of injury to life and limb, which have been reported to the Board of Trade during the year 1868. Parliamentary paper 162, July 1, 1869. The deaths for Scotland were 47, for Ireland 15. *See* page 234.

† The railway companies return 68 killed to 1557 injured by their default; the numbers injured by the passengers' own defaults is evidently wrong. It is only 16 injured to 37 killed in the three years 1866–7–8. I take the proportion from those killed and injured by the companies.

This degree of safety is only maintained by the laudable vigilance of the companies, and of their officers: and the vigilance is kept up by the heavy pecuniary fines to which they are liable for every injury or death inflicted on a passenger by their default.

Seeing the small number of accidents to passengers, it has been too readily assumed that there is no danger to passengers in railway travelling; and this saying has been quoted: "a person who wishes to put "himself in the safest place possible cannot do better than enter a first-"class railway carriage."

This is based on a fallacy. The rate of mortality from *all causes* is always given, like the rate of interest, so as to show the rate per cent., or per 1000 *per annum;* and at the age of 30 this is 10 per 1000, at 50 it is 20 per 1000 *per annum.* The railway mortality has been calculated hitherto on the journey, which is on an average of 9·6 miles and may be of half-an-hour's duration, more or less. The rate which has been given above is, therefore, *per half-hour*; and as there are 17,520 half-hours in the common year, the rate *per annum* is 17,520 times the rate per half-hour. When the multiplication is performed it will be seen that the rate of mortality on a constant average railway-travelling population is 2 per 1000. This is an appreciable addition to the ordinary mortality of men, which ranges from 10 at the age of *thirty*, to 20 at the age of *fifty*, and to 40 at the age of *sixty-three.*

Dangers can be numerically appreciated with great exactness on a large scale, but in practice it is not customary to take into account additions or diminutions of the rate of mortality not exceeding one-10,000th part: and men every day encounter dangers of that measured magnitude without hesitation. Unless they had this sufficient amount of courage human affairs could not go on; the lion in the path would bring everything to a standstill. But when the annual rate is raised under any exceptional conditions such as railway travelling by *one*, and certainly when it is raised by *two* in 1000, the increase under those conditions cannot be entirely neglected. The railway carriage cannot be held up as a harbour of perfect safety.

But taking the railway passengers rate of mortality at 20 in 10,000 for the whole year round it is evident that a season ticket-holder who is on an average railway only an *hour* a day for 300 days adds less than one-10,000th to his risk: it is, therefore, below the degree of commonly appreciated danger. For double the time the risk may be doubled; but even this is only an addition of 2 to the ordinary risk of 150 in 10,000 from all other causes incurred by a life of the age of *fifty*. Insurance offices constantly neglect such slight additional risks in dealing with men living in different circumstances, in different professions. As the assayer of gold cannot test its fineness from alloy with any certainty beyond the 2 or 3 ten thousandth part, so it is in scientific assays of the value of human life.

It is gratifying to find that the risk to the railway passenger has continually decreased since the early observations of the years 1840–3, when the passenger encountered a risk five times as great as our computation gives; and this improvement may be in part fairly ascribed to the laws under which railway companies are liable to heavy claims from injured passengers for damages. The least want of vigilance, inefficient training of the staff, overwork, defaults in the construction of the line, defects in the engines or the carriages, lead to most disastrous consequences.* Against the divers elements of danger we have the natural anxiety of the directors, and of a very skilful body of officers to

* See Neison's contributions to vital statistics, p. 247. His paper is an excellent digest of results deducible from the Board of Trade returns down to the year 1852. In 1840–3 *sixty-one* passengers were killed in 57,617,578 "passages," or *one* in 944,550. 260 passengers were injured. But the average distances travelled then were 18 miles for which allowance has to be made, as the distances are now less than 10 miles.

ensure the safety of the lives of their passengers. All their efforts in this direction are sharpened by the heavy penalties of the law. And it is easily conceivable that any relaxation of existing safeguards might lead to an immediate increase of danger to passengers, so that the deaths, injuries, and fears of travellers may become twice as great as they are now.

The "servants of companies or contractors" do not appear practically to enjoy the same legal protection as passengers, and they are killed in considerable numbers: in the year 1868 the companies returned 53, and "many companies" do not take the trouble to report such deaths to the Board of Trade, "not being required to do so by law." This is very evident, for in 1868 while 150 deaths on the railways in England and Wales are returned from all causes, to the Board of Trade, the total of such deaths distinguished in the registration returns are, after deducting 24 suicides, no less than 773! After the deduction of 53 passengers, and of 34 trespassers or persons killed at level crossings, 686 remain, who must have been chiefly "servants of the companies and contractors." No fines, we may presume, were inflicted in these cases, as the relatives would have no means of bringing actions under Lord Campbell's or any other Act. The workmen have no remedy when they are killed "by causes beyond their own control;" and their deaths in most instances are from causes under their control.

It must on these grounds and on others be admitted that the people at large, and the railway companies, have reason to be dissatisfied with the present state of the law. In the year 1867, when the railway companies returned the deaths of 28 passengers, 15 were killed by causes beyond the control of the said passengers; and 13 by "their own misconduct or want of caution," if we adopt the judgment of the companies in the matter. The persons injured in the two categories, they state, were 578 and 6, the latter evidently wrong; for that year the companies paid 322,985*l.* as "compensation for personal injury, &c."* This is a large sum; it is 2·4 per cent. on the 13,534,281*l.* of fare-receipts from passengers. It does not include all the legal expenses of the party injured; and we have no means of knowing the amounts or the per-centage on the sums awarded by juries.

The companies have just grounds to complain of the costs of litigation, which are probably included in the above sum, and of the uncertainty of awards, which are based on appreciations of the extent of injuries often obscure,† and of the value of men's life incomes, scarcely within the capacity of juries, or of the ordinary courts. The public have still greater ground for dissatisfaction. The families of poor men can derive little advantage from the law; and the result to the opulent is uncertain. Some railways deal with sufferers in a liberal spirit; others are said to oppose every claim by hostile litigation: here is another ground of inequality under the laws.

In endeavouring to arrive at remedies, four things have to be especially kept in view; (1) the principle that to ensure the utmost care on the part of the railway authorities loss of life or limb is to be compensated, so far as this can be equitably done, by payments in money bearing some reference to the economic value of the party injured; that (2) the railway should know beforehand the amount it may be called upon to pay; that (3) both the railway company and the person injured should be relieved from any unnecessary expense in obtaining an equitable settlement; and that (4) the tribunal for determining the extent of injury, the value of the life, and the division of blame, should be skilful and competent.

---

* Parliamentary Return, No. 484, 1868; what the "&c." means in the return is not clear.

† The difficulty of the surgical questions will be at once seen on referring to the Classic essay on "Railway and Street Injuries of the Nervous System, by J. E. Erichsen, Professor of Surgery in University College."

I have shown elsewhere that the economic value of men can be estimated by deducting the present value of their necessary subsistence from the present value of their future earnings. Thus, taking his wages as the basis, the value of a Norfolk agricultural labourer, at the age of 25, was found to be 246*l.** ; while the value of the income of a professional man earning 300*l.* a year being 5000*l.*, the deduction of his necessary professional subsistence may reduce the money value of his life to something like 3000*l.* By neglecting this element, the values of a life are sometimes exaggerated. The compensation for injury can never exceed the value of the life ; and the injuries to body and limb may be classified by a tariff, so as to bear definite proportions to the value of the whole life. The tariff would be subject to modification in singular cases which can be easily conceived ; thus the loss of a finger may deprive a great violinist of his fortune.

Objections may be raised to this principle of compensation. The lives of the Queen's subjects are all equal in the eyes of the law. And no one admits that a railway company can be justified in neglecting any precaution in the case of a single passenger, be he rich or poor. The same vigilance and care are required and given in all cases. Why then should the company pay more for the life of an officer than for the life of a soldier, for the life of a judge than for the life of a solicitor, for the life of a bishop than for the life of a curate. Yet the loss or injury on a carriage full of curates might not exceed 30,000*l.*, while the loss on the life of two bishops might raise claims for a larger sum. The answer to this is that the compensation in money is to the individual, or to his family, for the pecuniary loss, to which it must therefore bear some defined proportion. Besides, as all classes are mixed up in a train, the effect of the larger fines on the railway companies is to awaken a vigilance calculated to prevent injury—and that is after all the main object—to the lives of all classes be they of small, or be they of exorbitant value. It is possible, however, and even desirable to save disputes, expenses, and uncertainty, to try and find some average minimum amount, suitable to the majority of cases, and susceptible of expansion to meet exceptional instances. This can be done on the principle of Insurance.

(1). Thus to deal with the *Cases of Death for which the railway company is exclusively liable.* Let a fixed sum be paid by the company for each passenger killed by its default, and let the sum, varying for the three classes of passengers, be fixed after careful inquiry. I assume for the moment that the sums have been determined ; and that they are 1361*l.* for first class, £1000 for second class, and £600 for third class passengers.† Then the tariff of injury would be graduated on these scales : assume for the moment that on the 23 annual deaths from the companies fault the amount is £23,000 ; and that the rate for injuries is so graduated as to amount to an average of £300 ; then 519 injuries a year will cost £155,700; making with compensation for deaths £178,700. That is less by £144,285 than was paid by the English companies in 1867 as compensation for personal injury "&c." in the latest year for which we have returns. It leaves a reserve.

Where Parliament limits the fares to meet a special purpose it may limit the compensation.

(2). The passengers killed by what the return designates their own "misconduct or want of caution" appear at first sight to have no claim; but in each of these cases a small fine should be levied, in order to enforce attention to provisions of prevention on the part of the company. Here is an illustrative case :—A solicitor (J.) enjoying an income of £2000 a year is killed under these circumstances : he is startled from sleep and

* Journal of Statistical Society, March 1853, pp. 39–44. The value of the wages is £488 ; of the necessary subsistence £242.

† These sums are in proportion to the average fares of the three classes :—2·11*d.* ; 1·55*d.* ; and ·93*d.*

attempts to leave the carriage as the train starts; he is stopped by a servant of the company, who is an old soldier, and acts in strict conformity with the regulations; in the struggle J. falling between the platform and the iron wheels of the carriage is crushed to death. He is found stretched on the ground, with torn clothes, and a physician has to communicate the sad intelligence to his wife, now a widow, who was awaiting his return to dinner. He was killed, as the return would say, "by his own misconduct." But it was held by the jury, that if instead of a narrow step for the foot, the interval between the platform and the carriage had been protected, as it is in some other cases, J. could not have been crushed, his family could not have been deprived of £2000 a year. Another solicitor was killed shortly after, not under the same, but under similar circumstances. The structural alteration suggested by the jury involved some expense; it was not carried out. It may possibly be inexpedient on other grounds, but it is quite certain, that if in all such cases the company were subject to a fine on the old principle of the deodand, no means would be neglected to prevent passengers being killed by such "misconduct" of their own, or by any want of precaution on the part of the company.

(3). The guards, engine-drivers, stokers, and other servants of the company, who are killed by causes beyond their own control, are justly entitled to compensation, at a settled rate. The workmen of the company or of contractors, often strong but dull, require drilling, training, and instructing against the dangers of the line. The contractors and companies could by discipline prevent many deaths, and would exert themselves more diligently in this direction if they had in every case of death or injury on the line to pay a definite fine. Some of the companies liberally contribute to the friendly societies of their servants, which should be made the universal rule. The whole of the members of such a fund, as well as the company, should be called upon to contribute at every death on the line, to give every one an interest in saving life.

(4). There is no provision to meet those extreme cases from which the companies suffer, inasmuch as the claims upon them appear practically unlimited. How much has been demanded, I know not; but £13,000 it is said were paid in one case. £7000, £5000, £4000, £3000, £2000, and £1000 are apparently common claims. These cases give rise to expensive litigation, and the scientific estimate of the value of a life income, on which the amount hinges, is thrown into the hands, and left to the decision, of an ordinary jury. What the result may be is a matter of chance. A trial, for a family left destitute, is a hazardous speculation. These cases will be met by the companies insuring the lives up to £5000. The passenger will thus appraise his own life, and will pay a premium partly covering the risk, sufficient, with some addition from the company's reserve, to pay the sums insured wherever the passenger is killed on the line, whether by accident to the train or otherwise. Thus in three years,* 35 passengers were killed annually: 12 by their own want of caution or misconduct, 23 otherwise. This is from the companies' return. The proposal is to pay the *insurance* on the 12 deaths, as well as on the 23 deaths. These sums are insured by special premiums paid by the passengers; and will therefore be independent of the compensations covered by the tariff under the first head.

I may here answer a preliminary objection: "There are *Railway* "*Passengers Insurance Companies* in existence, and any other insurance "is unnecessary." The answer is: these companies have no control whatever over the causes of death and injury, and the principle here upheld is that the losses on lives should be met by the parties, who can exercise a certain control over the events against which insurance is effected. Besides, these insurance companies limit their insurances to

* 1866-8.

£1000 ; and if the returns of the companies are complete, the insurance is curtailed of its fair proportion by a proviso, somewhat misleading, that the insurance shall extend "to such injury only as shall be caused "by some injury or *accident to the train.*" They pay for nothing beyond the above 23 deaths; so for a third of the deaths returned they pay nothing ; and the death of J. above cited under such a policy, would not have been by *accident to the train;* and had he held a policy his family would have got nothing from a Railway Passengers Insurance Company. Their general Policy even apparently does not cover all the deaths by accident on a railway, while it extends to other accidents.

An action by law is now maintainable against a person who by his *wrongful act, neglect,* or *default* may have *caused the death* of any person.* This action, under the Act, can now be brought "notwithstanding "the death of the person injured." Every such action shall be for the benefit of the wife, husband, father, mother, grand-father, grand-mother, step-father, step-mother, son, daughter, grand-son, grand-daughter, step-son, and step-daughter of the person killed. The jury may give such damages, as they think *proportioned to the injury resulting from such death to the parties respectively* for whose benefit the action is brought.

By the judicial statistics, we learn that 203 actions were brought under the Act in the year 1868; 122 of the verdicts were for the plaintiff, 3 were subject to special case or reference ; 29 verdicts were for defendant, in 6 jury was discharged without verdict, in 5 a juror was withdrawn, 38 were cases of nonsuit, or were otherwise disposed of. The total amount recovered was £68,092 ; which if equally divided among the successful plaintiffs, taken at 124, gives an average of about £549 ; in 9 of the cases the damages were £1000 to £2000 ; 6 were £2000 to £3000 ; 1 was £3000 to £5000 ; and in 1 the damages were £9750.† 98 actions were brought for other injuries from negligence; of which 47 resulted in verdicts for plaintiff, 4 were subject to special case, and 9 to reference ; £7202 were recovered, we may assume by 60 plaintiffs, or on an average £120 each. The largest damages in a single case are said to have been between £2000 and £3000.‡

The expenses of the 301 trials are not stated, but they would necessarily be large : and the dread of expense necessarily deters many executors from moving. To meet this difficulty to some extent, the Act was, in 1864, amended by 27 & 28 Vict. cap. 95, which gave other persons beneficially interested power to bring actions.

Many of these actions were brought against railway companies ; but the whole amount of £75,294 recovered goes but a short way towards the compensation for personal injury as shown in the returns to the Board of Trade. There is a wide margin for law expenses, and the greater part of the residue must go to meet unlitigated claims.

(4). Any common tariff to compensate for deaths or injuries can only provide for the cases of persons of moderate fortunes ; and should only be pitched to meet a part of the pecuniary damage sustained, as the fine is not vindictive but preventive, and in mitigation of a family's losses. Railway Life Insurance by the companies ensures the continuance of vigilance on their part, substitutes definite for unlimited claims, and gives families the fullest benefit free from the uncertainty and expenses of litigation.

The insurance could be most conveniently effected by annual policy tickets, to be issued by each company, but in such terms as to insure, for

---

* Preamble to 9 & 10 Vict. cap. 93. Lord Campbell's Act is entitled, "An Act for compensating the Families of Persons killed by Accidents." (26 Aug. 1846.)

† This was an action of "Howard *v.* The Great Indian Peninsula Railway Company, tried at Lewes, Sussex, on 17th July 1868, before Mr. Justice Willes. The jury found a verdict for the plaintiffs for 9,750*l.*, which they distributed thus :—to the widow 3,750*l.*, and to each of three children 2,000*l.*"

‡ Judicial Statistics, 1868. Part II., pp. 3–11.

a commensurate premium, any sum from £500 up to £5000, payable by the *company owning any railway in the United Kingdom, on which the passenger insured was killed*; and in case of injury a sum proportional to the extent of loss, always a fractional part of the sum insured, sustained by the passenger.

The risk of death on a single journey being so slight we have no coin small enough to pay a premium for £1000; but taking 600 average journeys, nearly 6000 miles for the year's travel, of an average person likely to insure, the exact premium calculated on the companies' own returns to the Board of Trade is 1*s.* 5*d.* (£·072) for £1000 on each death: take the injuries by the same returns at 15 to each death $\left(\frac{524}{35}\right)$; and let the damages for an injury be on an average 1-third of the sum insured at death; they would necessarily have a large range as the injury was slight or severe; then the premium to insure against injury would be 7*s.* 3*d.*, making 8*s.* 8*d.* in the aggregate. To settle the premium minute preliminary inquiries would have to be made into all the results of experience attained, and into the circumstances affecting the loss of value of the professional life by injuries, but for the purpose of illustration let it be assumed that 8*s.* a year will henceforward insure the passenger's life to the extent of £1000 against death or injury by any railway accident, without raising the question of default on his own or the company's part; and of this let 7*s.* be paid by the insurant, 1*s.* by the company.

The insurance might be thus worked. The passenger would take out an annual policy; the premium being 7*s.* for £1000; 35*s.* for £5000. If he take out a season ticket he will take out the insurance ticket at the same time; and in all other cases he will take his insurance ticket at the station nearest to his residence. Each railway in the United Kingdom will issue insurance tickets, and the premiums will be paid into one fund under separate accounts; and the compensations for death or injury on each railway will be written off the account of that railway which will be called upon to make up its own deficiencies. There will be many arrangements of detail necessary to insure the well-working of such a system; but it could all be brought in England under the railway clearing house system. The premium should be subject to approval by a Government office, and be so rated as to render it the interest of companies to reduce the current mortality.

I have assumed for the moment that the insurances would not be taken for more than £5000; but as sometimes larger sums are awarded it may be deemed right to insure for larger amounts; at the above rates a man of large professional income might insure £10,000 for an annual premium of £3 10*s.* The actual compensations are paid by the passengers, whose fares are fixed with due reference to the compensations as well as other charges, and the premiums for the additional sums required to meet the cases of lives of more than ordinary value would relieve the companies to a considerable extent.

Each man having appraised himself in his policy no further question of the economic value of the whole life could be raised. That would be fixed by the tariff for all uninsured cases, and by the policy of insurance in other instances. It is understood that the tariff price would be paid on every person killed by the default of any railway company, as well as the extra sum insured.

The cases of *injury* are so infinitely diversified, and so difficult to measure, that to deal with them it may be necessary to establish a special court of arbitration, consisting of a barrister, a surgeon, and an actuary, who would soon acquire experience and be able to lay down general rules for future guidance.

Under these arrangements, we may expect improved means for the prevention of deaths in travelling on railways, and fewer deaths among the servants of the companies and of the contractors. At the present time a battalion is killed every year.

Deaths by horses and by other animals.

The number of deaths by other animals than horses, in this country, is not great in these days; and the horses kill men indirectly by throwing their riders in hunting, racing, or travelling; by kicking or by running over them. They are most frequently fatal when used as a means of conveyance. The number of persons killed by horses or other animals was 269 in the year; of whom 251 were males, and 18 were females. Of the boys 11 were under 5 years of age; 26 were 5–10; 30 were 10–15; many of these were young equestrians. The numbers afterwards decline as the youths grow skilful or cautious. Old men who persist in hunting appear to pay the penalty of persistence by frequent death.

The persons killed by carriages, omnibuses, cabs, vans, waggons, and drays include waggoners and other drivers who are not themselves carried. Other people on foot are killed by horses and drivers; the former supplying power, the latter direction. The driver only incurs danger if he upset his vehicle; but he incurs no physical danger himself by running into or running over other people, and has little to apprehend from the laws if the victims themselves are at all to blame. He has also good chances of escape altogether. The deaths by horse conveyances were at least 1331 in number.

203 persons killed in the streets of London.

The numbers under this head are so great as to generally excite surprise. They have attained an extraordinary magnitude in recent years.*

To these deaths attention has been specially directed in the Weekly Tables since March 5th, 1864. Still they have gone on increasing. In the year 1867 the numbers were 164, in the year 1868 the numbers ran up to 203. That number killed implied about 2,900 wounded or mutilated, more or less severely.† The fatal carriages were not distinguished in the Registration Returns in 58 cases; but of those distinguished only 12 were omnibuses and 21 cabs, while 105 were vans, waggons, drays, or carts. Seven deaths were referred to horses, without any mention of vehicles. The return for the year 1869, during which continued attention was drawn to these disasters by the publication of every reported

---

* Dr. Johnson gives this danger no prominence in his gloomy picture of London:—

> " For who would leave unbrib'd Hibernia's land,
> " Or change the rocks of Scotland for the *Strand?*
> " There none are swept by sudden fate away,
> " But all whom hunger spares, with age decay:
> " Here malice, rapine, accident, conspire,
> " And now a rabble rages, now a fire;
> " Their ambush here relentless ruffians lay,
> " And here the fell attorney prowls for prey;
> " Here falling houses thunder on your head,
> " And here a female atheist talks you dead."—*Johnson's London.*

Gay, indeed, in his walk through London by night describes the perils of the streets in the last century. (Trivia, Book III.)

† Colonel Henderson returns 83 run over and killed in the Metropolitan Police district, and 1265 maimed or injured. In the four years March 1st, 1866, to June 30th, 1869, Colonel Fraser returns 28 killed and 654 maimed and injured in the city of London; the numbers returned by the Metropolitan Police during the same period as killed were 343, the maimed and injured 4647, making in the aggregate 371 killed and 5301 maimed and injured. One was killed to 14 injured.

case, shows a slight decline, chiefly noticeable in vans and waggons, at the end of the year. Colonel Henderson twice during the year called the attention of the police to the necessity of checking reckless and furious driving. 197 persons were apprehended and charged with the offence of furious driving in 1868; and 312 persons in 1869. The convictions in the two years were 172 and 267; the summonses applied for were 235 and 455.*

That the dangers of the streets of London are considerable is evident. The 203 deaths in this single city look large by the side of the deaths on the railways of all England. They are, when compared with the whole population of London,† below the numbers occasioning appreciated danger; but only a part of the population is exposed to risk in the streets during a part of the 24 hours; women, children, and workmen, for many hours of the day being at home, school, or work; so an exact estimate of the risk cannot be framed without an hourly census for a certain number of days. But if half a million of people are in the streets on an average during 12 hours, that will reduce the average equivalent quantity exposed to risk for 24 hours to 250,000. Then many of these people are in streets out of thoroughfares, where there are few carriages of any kind; allowing for this, the numbers actually at risk may be reduced to 100,000; among whom the mortality will be 2 in 1000 exposed to risk for a year, or the same as on the railways. But upon inspection it will be seen that the persons on the footpaths, protected by kerbstones, are exposed to no risk; and that the persons in the streets moving rapidly are in comparatively small numbers, except at crossings. They encounter there greater risks than railway travellers. The dangers of the streets have now attained a pitch which commands public attention. What are the causes of these deaths? What are the remedies?

These are manifold. It is evident, in the first place, that the railways while their circuit is incomplete, throwing into London goods of every kind, requiring rapid delivery, have largely swollen the traffic. And the heavy vans and waggons drawn by heavy horses, no longer moving at a slow pace, driven at a trot, cannot be pulled up by their drivers, often unskilful. The mass once set in motion goes on; and it is noticeable that these heavy vans have no effective drag, so that downhill the driver goes on helplessly over his victims.

What power has the police in this matter? The Metropolitan Police Act‡ declares that every person shall be liable to a penalty of *not more than* 40 *shillings*, who shall in any thoroughfare or public place *ride or drive furiously*, so as to endanger the life or limb of any person, or to the common danger of the passengers in any thoroughfare. Then there is Lord Campbell's Act, and the common law punishes wilful injury to life or limb. This power is evidently ineffectual. In the first place negligence and unskilful driving by a vanman is as often fatal as furious and skilful driving by a cabman. The laws do not meet the case. One of our oldest laws did meet it, and instead of being abrogated should have been adapted to the present state of things.

---

* Here is one of the Police Orders:—

"*Tuesday, 4th May* 1869.

"Furious Driving.—Attention is called to the law respecting reckless and furious driving in the streets—2 & 3 Vict. cap. 47. sec. 54—which is to be strictly enforced.

"Special attention should be paid to all persons, especially drivers of vans and light carts, driving furiously round corners or over crossings frequented by foot passengers."

† Population 3,126,635; deaths from the causes above referred to, in the streets 203; or 1 in 15,402.

‡ 2 & 3 Vict. cap. 47, s. 54.

The 9 & 10 Vict. cap. 62 (18 August 1846) abolishing deodands, opens with this preamble : " Whereas the law respecting the forfeiture of " *chattels which have moved to or caused the death of man* is *unreason-* " *able and inconvenient;*" and enacts that there shall be no forfeiture of any chattel for or in respect of the same having moved to or caused the death of man, and no coroner's jury shall find any deodand whatsoever.

Wise laws were frequently enacted by legislators of old for reasons which later ages have deservedly not respected. Thus it was with the law of deodands, which is thus declared by Bracton : " If a horse, or ox, " or other animal of his own motion kill as well an infant, as an adult, or " if a cart run over him, they shall in either case be forfeited as deodands ; " which is grounded upon this additional reason, *that such misfortunes* " *are in part owing to the negligence of the owner ;* and therefore he is " properly punished by such forfeiture."*

There can be no doubt that if every van, or carriage, that killed a man in London, were forfeited, it would lead to an immediate diminution of the 200 annual deaths in the streets.

The deodand, it will be observed, did not raise the question of criminality, or even blame ; but it had the effect of making every owner of a dangerous conveyance take the utmost care, by the appointment of a skilful driver and by other precautions, to prevent the " killing of infant or adult."

Here are the arguments against deodands. They were at first devoted to Holy Church, which undertook to say masses for the departed soul : this was after the reformation pronounced a superstitious use ; and before that date the king had claimed deodands, and often given them away to lords of franchises. This was undoubtedly a perversion of the penalty ; which should have gone to the family of the man killed, the natural inheritors of his soul's affections. Hence juries on this ground, and because they did not perceive the philosophical principle of the law, and because, often possessing waggons or carriages themselves, they sympathized with the hardships of owners, often very little to blame directly, took " upon themselves too frequently to mitigate these forfeitures by " finding only some trifling thing, or part of an entire thing, to have been " the occasion of the death." Hence the deodand was abolished in the year 1846, and it cannot now be revived in its old form.

Every object would be attained in the prevention of street deaths, by inflicting a fine, of a certain range, but of sufficient amount to make drivers and owners careful not to kill their fellow creatures. Perhaps fines ranging from £5 to £50 in every case would suffice, unless by going higher the cases could be withdrawn from the operation of Lord Campbell's Act. The fines should be levied on driver and owner, in proportions expressed in the judgment ; and go to the families as under Lord Campbell's Act, or to the Consolidated Fund when no such relatives existed. Given to widows and fatherless children the fine would in truth be given to God.

The cause and the prevention of street accidents might with advantage be inquired into by a commission, or by some competent man. In the meantime the following points deserve attention :

1. The creation at crossings of more places of refuge.
2. The licensing of all drivers of heavy waggons and vans who drive at a trot through the streets, so that there may be some security for skill, as is now the case with the less dangerous cabmen. Such carriages to bear a licence number.

---

* Bract, l. 3. c. 5., cited in Law Dictionary by Sir T. E. Tomlins, 1835.

3. A police regulation to ensure the use of such drags as will enable the driver to stop instantly his carriage, at any allowed velocity.

4. The enactment of a system of moderate fines, on the drivers and owners of carriages, who kill or injure passengers in the streets; to vary with the nature of the case.

5. Spectators who witness street accidents should be ready to arrest, to take notes of, and to give evidence against offenders, in the public interests.

6. Playgrounds at the schools and in the squares will keep many children out of danger.

7. Foot passengers should consider beforehand how to cross the streets of London safely; how to be at once cool, attentive, alert. People who are deaf, short-sighted, lame, or infirm, should take especial precautions.

I have the honour to be,
Sir,
Your obedient servant,
WILLIAM FARR.

To
The Registrar General.

Note.—I have to thank four of the Railway Companies for supplying me with the following information of the amounts paid by them in compensation for personal injuries during the years 1866-68:—

	1866.	1867.	1868.
London, Brighton, and South Coast Railway	£48,744*	£33,038*	£7,637*
London and South Western Railway	4,504†	1,714	7,147
South Eastern Railway	36,791	10,108	8,988
Manchester, Sheffield, and Lincolnshire Railway‡	7,971	13,972	5,289

* These sums include 2,813*l.* in 1866, 1,429*l.* in 1867, and 252*l.* in 1866 as costs of award.

† This sum is exclusive of 7,971*l.* paid in 1866 for the Egham accident, which occurred in a previous year.

‡ The total number of accidents attended with personal injury to passengers during the three years was 294; and in 247 of the cases compensations amounting with costs to 27,232*l.* were paid. Of the total sum 17,723*l.* were paid upon official negociation, the costs of settlement being 1,993*l.*; the amount awarded by juries was 4,605*l.*, and the costs of such litigation, &c. were 2,911*l.*

TABLE 1.—**Deaths** in **England** from **Scarlatina, Cynanche Maligna,** and **Diphtheria,** for each of the **Years 1855** to **1868.***

YEARS.	TOTAL.	SCARLATINA.	CYNANCHE MALIGNA, and DIPHTHERIA.	CYNANCHE MALIGNA.	DIPHTHERIA.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with that in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

TABLE 10.—**Causes** of **Death** registered in **England** in each of the **Ten Years 1859–1868**—*continued.*

† In the years 1852–57 cases of so-called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line.

‡ For the years 1858–68 the number of deaths in which the cause was not specified was distributed pro rata over all the causes in the Table.

TABLE **12.—Causes** of **Death** in **England** in **1868.** Proportional Numbers dying from each Class of Causes, and from each Cause.

The Mean Annual Mortality in the 15 years from All Causes and from Specified Causes is the mean of the three quinquennial periods, and not correspond exactly with the totals of the Orders and Classes; because under certain heads, for example, *Homicide*, *Suicide*, and *Causes specified*, &c., the complete details cannot be given for the entire period.

Mean of 3 years. ‡ Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

Mean of 2 years.

TE.—In a certain number of cases in each year the cause of death was not stated. In calculating the proportional numbers, since 1855, have been distributed pro ratâ over all the causes in the Table.

TABLE **13.—Mean Annual Rate** of **Mortality** in **England** from each CLASS of CAUSES and from ea CAUSE during **Three Periods** of **Five Years**; and **Rate** of **Mortality** in the Year **1868**—*continued*

* This death was registered on 19th January 1866.

TABLE 21.—**Railways of England and Wales in the Year 1867.**

(*See Parliamentary Return No.* 484, *Session of* 1868.)

—	Number of Passengers (exclusive of Holders of Season and Periodical Tickets).	Average Fares* per Mile.	Receipts from Passengers (excluding Season Tickets).	Estimated Number of Miles travelled.
		d. £	£	
First Class - -	27,093,001	2·11 = ·00880	3,391,567	384,942,854
Second Class - -	71,720,368	1·55 = ·00646	4,454,099	689,494,525
Third Class - -	151,785,613	0·93 = ·00387	5,202,028	1,344,204,035
TOTAL -	250,598,982	1·29 = ·00539	13,047,694	2,418,641,414

* The average here given is derived from the Fares of the 12 longest lines in England.

NOTE.—The number of holders of Season and Periodical Tickets was 84,418, and the receipts from them amounted to 486,587*l.*, or 5*l.* 15*s.* to each.

The length of line opened on 31st December 1866 was 9,701 miles.
" " on 31st December 1867 was 10,037 miles.

Number of Trains run in the year 1867 :—

Passenger Trains - -	3,293,882
Goods Trains - - -	1,930,964
TOTAL - -	5,224,846

Number of Miles travelled by Trains in 1867 (not including the shunting of trains and engines) :—

Passenger Trains - -	61,572,474
Goods Trains - - -	60,491,467
TOTAL - -	122,063,941

Dividing the aggregate receipts from passengers by the number of passengers in the year 1867, it is found that each journey costs on an average *one shilling*.

On the assumption that each ordinary passenger is on the line half an hour, the whole time spent in railway travelling would amount to 14,304 years of life, or, allowing for season ticket holders, to 15,693 years of life; and as 35 deaths occurred annually in the three years 1866–8, the annual rate of mortality was equivalent to 2·1 deaths per 1000 living. The season ticket holders are here estimated to travel 233,561,760 miles on the assumption that they are charged at the rate of $0\frac{1}{2}d.$ a mile. This rate is quite conjectural, but it affects only a small portion of the passenger traffic.

The mortality is inversely as the time, and if the time of each journey exceeds half an hour the above rate will be diminished, and conversely. Thus, if the average time of each journey is *an hour* the mortality rate becomes 1·05, if *a quarter of an hour* it becomes 4·2 per 1000 per annum. Thus when the exact velocity of railway travelling is known the ratio can be corrected.

In the year 1867 the *total receipts* of the English Railway Companies amounted to 33,398,222*l.*, their *net receipts* to 16,633,702*l.*, their total *working expenditure* to 16,764,520*l.*, and the total amount paid in *compensations* for personal injury, &c. was 322,985*l.*

The following symbols in future calculations might be of use :—

$$\text{data}\begin{cases} p = \text{passengers (more properly "passages") in one year.} \\ \text{F} = \text{total fares received in £} \quad \text{,,} \\ f = \text{rate of fare per mile £} \quad \text{,,} \end{cases}$$

$$\text{unknown}\begin{cases} \text{M} = \text{total mileage paid for} \quad \text{,,} \\ m = \text{miles to each "passage"} \quad \text{,,} \end{cases}$$

As f is paid for one mile : F will pay for M miles ; and $\frac{\text{F}}{f} = \text{M} =$ Total mileage paid for.

But if this M is divided by p it gives the miles to each "passage" $= m$.

$$\therefore \frac{\text{F}}{pf} = \frac{\text{M}}{p} = m \text{ miles to each passage.}$$

As f differs for each class separate calculations are made for the three classes, by the formula $\frac{\text{F}}{f} = \text{M}$; the sum of these values of M give the mileage for the three classes : which may be divided by the sum of the "passengers."

If we know the average rate at which trains travel, say it is v miles an hour,

Then $\frac{m}{v} = t_1 =$ time in hours required for travelling over m miles.

In the present case let $v = 19{\cdot}2$ and $m = 9{\cdot}6$, then

$$\frac{9{\cdot}6}{19{\cdot}2} = t_1 = \tfrac{1}{2} \text{ hour} = {\cdot}5$$

Let the *time* occupied by each "passage" p be expressed in fractions of a year then $\frac{t_1}{24 \times 365} = t$; and $pt = y =$ years of life passed on the railway. An addition has to be made for the 84,418 season ticket holders, who paid 486,587*l.* ; this can scarcely exceed 1389 years of life, and may be less.

After these calculations the life at risk is equivalent to 15,693 passengers on an average constantly on the line through the year. As there are 17,520 half hours in a year, on the above assumption, each *year of life* is made by a succession of 17,520 half hour passages. Taking the annual deaths of passengers at 35, the railway mortality is at the rate of $\frac{35}{15{,}693} = {\cdot}0021$

It may be taken at 2 on an average constant railway passenger population of 1000.

APPENDIX B.

Report to the International Statistical Congress held at the Hague in 1869, by William Farr, M.D., F.R.S.

Introduction.

I propose to give some account of the progress of the question of metric weights and measures in England, and to discuss some proposals which have been made for the adoption of an international coinage. That lies at the root of comparative statistics, and until there is an international money of account one of the great objects of the Congress must remain in abeyance.

Statistical science can make little progress until its measures of value, like its other measures, are identical. The unit of population is the same; and we have now or shall soon have all lengths, areas, volumes, and weights in national returns expressing in numbers the same metric units.

The measures of value are still fallacious, misleading, and discordant. How could we reason about the figures, if countries employed metres or hectares in units, one day expanding, another day contracting. Yet the money units of countries where paper is inconvertible vary to an inconceivable extent; and the value of articles of commerce, national expenditure, and prices expressed in such paper have never any definite meaning. Where the coinage is not sustained at its standard weight, similar uncertainties spring up. And where two precious metals are coined, and are both legal tender to any extent, the fluctuating values of two metals instead of one, that is two variable measures, and where they are joined with inconvertible paper, three different measures of value come into play. The cheapest of the three denominations for the time being always regulating prices, and chasing its rivals away to other regions or uses where they happen to be appreciated. It is evident that for scientific purposes, definite weights, either of gold or of silver, not both, must be accepted as the measuring unit of value.

The Congress has rightly refused to accept definitely any existing money, as no system is based on the decimal multiples, and sub-multiples of the gram weight of silver or of gold. Holland, it is true, has the single standard; and has a decagram silver currency, which is preferable to the *five gram* franc; but the florin is ·945 fine; and it is too small a unit to measure the great masses of value with which international statistics deal.

Until an international coinage is created, the Congress may use as *its statistical units of value* decagrams of gold nine tenths fine, with grams and centigrams for the subordinate units. Upon this basis the relative value of all commodities to each other can be accurately determined; and the problem of the variations in the relative value of gold itself at different times, and in different places, can be discussed in the simplest form.

The adoption of the metrical gold unit for scientific purposes will pave the way to the coinage of the decagram; and it will be an additional service to mankind if the Congress thus brings nations into agreement, and into the use of the same related units of weight, measure, value, all over the civilized world.*

In England the Standards Commission has just reported to the effect, that "the time has now arrived when the law should provide, and facilities be afforded by the Government, for the introduction and use of "metric weights and measures in the United Kingdom."†

And with reference to money, these eminent authorities, observing that the metric system includes the *relation of coinage to weights and measures*, particularly in its uniform decimal scale, are of opinion that, even if the difficulties of establishing an international unit of coinage cannot be at present overcome, yet the decimalization of our system of coinage, which is in the power of the Government, would be very useful to the public.

The Royal Commission on International Coinage in their recent report do not recommend that England should merely adopt a gold coin of the value of 25 francs; but they entertain no doubt that an uniform system of coins, bringing into harmony the various standards of value and moneys of account, alike in their higher denominations and their lower subdivisions, as well as an uniform system of weights and measures, would be productive of great general advantage. To establish an international currency very difficult questions will have to be settled, and concessions made on the part of all nations; and in the opinion of this Commission the subject can be most satisfactorily dealt with "by authorized repre-"sentatives of the different countries" meeting in an international "conference."‡

The Chancellor of the Exchequer (the Right Honourable R. Lowe), before Parliament separated, discussed the question of international coinage in an enlarged, practical spirit, and evinced the willingness of Her Majesty's Government, under just conditions, to co-operate with the other Governments of the world in realizing this grand purpose.

I.—Weights and Measures.

The utility of the metrical system for all statistical purposes has been recognized at every meeting of the Congress. It is impossible to compare the statistics of the various countries of the world with each other, when the figures represent units of variable values, without an excessive amount of labour. The time has come, in the opinion of the Congress, to act decisively in this direction.

In the meantime, on the motion of M. Baumhauer, the delegate for Holland, seconded by M. David, the delegate for Denmark, the heads of statistical departments of different countries were requested to prepare tables of their weights, measures, and moneys, with the values in the units corresponding, actually in use in the principal states of the world.

---

* The Congress at its last sitting, invited the authors of the proposed international work to render the values in francs, and in decagrams of gold nine tenths fine. (*See* p. 284.)

† Standards Commission, *Second Report*, 1869.

‡ Report on International Coinage, p. xviii. The Commission consisted of Lord Halifax, the Right Honourable C. P. Villiers, the Right Honourable S. Cave, Colonel Wilson Patten, M. Longfield, LL.D., Sir John Lubbock, F.R.S., T. Baring, Esq., Baron L. N. Rothschild, J. B. Smith, Esq., T. Hankey, Esq., J. G. Hubbard, T. N. Hunt, Esq. (Governor of the Bank of England), Professor Airy (Astronomer Royal), and Professor Graham (Master of the Mint). Among other witnesses who gave valuable evidence before the Committee were Col. J. T. Smith (Master of the Mint in India), F. Hendriks, W. Newmarch, W. S. Jevons, W. Bagehot, S. Brown, Right Hon. G. J. Goschen, Sir J. Bowring, L. Mallet, C. B., Professor Leone Levi.

In compliance with this request, we have compiled from the best accessible sources the annexed tables.*

1. *Money Units.*

The Congress it will be recollected, fully recognizing the utility of a single money unit for the world, suggested that in the interim the units in use should be reduced to the smallest number possible ; such, for example, as the franc, the dollar, and the pound sterling ; that the value of these units should be rendered, by slight modifications, simple in their numerical relations to each other, and that the subordinate should be related decimally to the primary units.

The time has now come for the Congress to advance further in the settlement once for all of the monetary units.

Note.—*A heavy half sovereign weighs* 4 *grams; consequently a fourth part of it is one gram by weight, and half crown in value. A heavy sovereign weighs* 8 *grams.*† *A decagram is* 10 *grams, and in gold is worth* 10 *half crowns. The gram is the unit of the metric system of weights.*

II.—International Coinage.

This question has since the Statistical Congress met assumed new phases. Two important proposals have been made : (1) To coin a 25 franc piece in gold $\frac{9}{10}$ths fine, weighing 8·0646 grams ; (2) to coin a piece of gold weighing exactly ten grams, worth $1\frac{1}{4}l.$ = 10 *half-crowns* = 25 shillings in our coinage, worth about $5\frac{1}{2}$ gold *milreis* in Portugal, 6 silver or gold *dollars* in America, 8 silver *roubles* in Russia, $8\frac{1}{2}$ *thalers* in Prussia and North Germany, 11 *rigsdalers* in Denmark, 12 *escudos* in Spain, $12\frac{3}{4}$ *florins* in Austria, 13 *rupees* in British India, 15 *guldens* in South Germany, 15 *florins* in Holland, 22 *riksdalers* in Sweden, and $31\frac{1}{2}$ *francs* in France, Belgium, Switzerland, and Italy.

1. *Coinage of a sovereign containing the same quantity of fine gold as a new* 25 *franc gold coin : seignorage.*

In 1867 an international monetary conference was held in Paris, where the Master of the Mint and Mr. Rivers Wilson attended on the part of Her Majesty's Government. At that conference were representatives from twenty states, including, among others, England, the United States, France, Italy, Prussia, Austria, and Russia. The conference decided unanimously in favour of the single gold standard, although that standard was in use at the time only in two states, England and Portugal. They also decided in favour of the standard of fineness, 9 of gold to 1 of alloy, as it is the almost "universal rule in the mints of Europe and in the United States." The common coin fixed on by the Commission was a *five franc gold piece*, which, with its 3 multiples of 10 francs, 20 francs, and 100 francs, is coined by France, Italy, Switzerland, and Belgium. At the special instance of Mr. S. B. Ruggles, the able delegate of the United States, the congress decided unanimously to recommend the coinage of a 25 franc gold piece, weighing 8·0646 grams, containing 7·2581 grains of fine gold and ·8065 grain of alloy. The English sovereign weighs 7·9882 grams, of which

---

* See Tables XVI. and XVII., pp. 282–3.

† The sovereign may by tolerance of weight be 8·005 grams or 7·972 ; the standard weight is 7·988.

7·3225 is fine gold, ·6657 gram alloy. It is only ·0118 gram below the round weight of 8 *grams.**

England to be a party to international coinage, of which the utility is self-evident, was invited to put 112·006 grains instead of 113·001 grains of fine gold into its gold sovereign. This grain of gold is worth about 2*d.*, which it has been argued may be justly taken by the Mint to cover the cost of the coinage without altering the value of the sovereign *wherever it is or shall be the current legal coin.* The evidence here was conflicting, and the validity of the argument in favour of this view is not admitted in the report of the Royal Commission over which Lord Halifax presided.

There can be no doubt that our present system of coinage is unsound in principle and unsatisfactory in practice. The Mint charges nothing for converting standard gold into sovereigns, and the expense of manufacture is thrown on the national Exchequer. Now while there are good reasons for retaining the gold coinage as a monopoly in the hands of the Crown, no sound reason whatever has been assigned for doing the work gratuitously. Why should the nation coin gold for nothing when it realizes a profit by the delivery of letters? When it charges a high seignorage on the coinage of silver, which is legal tender up to 40*s.*, and on copper coins ?† The "poor man's penny"—a legal tender up to 12*d.*—pays more than the cost of coining; the gold of the bullion dealer is turned into sovereigns for nothing. In practice the Bank paying its paper in coin, justly regulates the coinage of gold, but dealers get and export sovereigns over the current weight, while the worn and light pieces are left in England. "There can be no doubt," said Sir John Herschel, then Master of the Mint, "that a large amount of British sovereigns finds "its way directly or indirectly into foreign melting pots."‡ The gold coinage in the year 1853 was 11,952,391*l.*; in the year 1864 it was 9,535,597*l.*: no one imagines that this was for domestic use.§

Any person who sends the gold bar for 10,000*l.* can, it is said, get gold coined at the Mint at the rate of 3*l.* 17*s.* 10½*d.* for each ounce of standard gold; but it has to be left at the Mint an uncertain number of days, and dealers now prefer going to the Bank of England, which buys standard gold, unless it is in the form of light coin, at the rate of 3*l.* 17*s.* 9*d.* an ounce, and sells it at the rate of 3*l.* 17*s.* 10½*d.* The Bank thus gets 1½*d.* on every ounce of gold that is coined, as it can issue notes against gold whether the gold is in the Mint or in its own cellars, while a dealer might lose not only interest of money but the advantages of turns of the market during the detention of his gold at the Mint. Instead of 934½*d.* the dealer now gets 933*d.* for every ounce of standard gold; the 1½*d.* is a kind of brokerage which the Bank levies for its services; 38½*d.* on every 100*l.* of bullion converted and this may be compared to the 30*d.* or the half-crown charged by the broker for transferring 100*l.* of consols. The Bank transfers 100*l.* of bar gold into 100*l.* of money for 3*s.* 2½*d.* The Bank

---

* See Report in Appendix to Registrar General's 16th Report, p. 110. In the Introduction to English Life Tables, p. 29, I pointed out the facility with which the sovereign by a slight addition of alloy might be made exactly 8 grams, each gram being worth half-a-crown.

† Silver is bought by the Mint at the market price and coined at the rate of 66*s.* to the 12 oz. of standard silver, that is at 66*d.* per ounce. Now taking silver as worth on an average $\frac{1}{15\cdot5}$ its weight of fine gold, an ounce is worth only 60$\frac{7}{8}$*d.*, consequently 5$\frac{1}{8}$*d.* is taken, and the seignorage is 7·75 per cent. At the present average price of copper, tin, and zinc, bronze is worth 10*d.* per lb., consequently the actual metallic value of the bronze in *one penny* is *one* farthing, the seignorage is 75 per cent. on the "intrinsic value."

‡ Appendix to Report of Royal Commmission on International Coinage, pp. 325–6.

§ Large sums were coined for Australia.

takes care to make a profit by its business, and its present charge is so low as to render competition impossible. In the year 1828 the Bank gave only *3l.* 17*s.* 6*d.* for bullion; it gave 4½*d.* less for every ounce of standard gold bullion than was contained in the coined ounce, or took more than a penny (1·15*d.*) for every sovereign coined.* Rothschild under these circumstances sent his bullion to the Mint, where in due time he got *3l.* 17*s.* 10½*d.* of coin for every ounce of standard gold, and the Bank has since paid *3l.* 17*s.* 9*d.* an ounce for standard gold, as at that price no one can compete with her. The Bank 4½*d.* had the same effect as a corresponding seignorage, for it made *3l.* 17*s.* 6*d.* of coin in gold or notes worth in the mind of the seller of bullion an *ounce* of gold, which when coined became *3l.* 17*s.* 10½*d.*

Seignorage is a mint charge for coining gold; and if for coining a sovereign of 113 grains of fine gold the Mint retains one grain of gold for its pains, and stamps a sovereign of 112 grains of fine gold, that charge of one grain so levied is properly called *seignorage*. If the coin of 113 grains is stamped and any sum besides is paid to the Mint for coinage, the charge so levied is described as *brassage*.

Political economists hold that seignorage should be charged;† and that within certain limits it leaves the coin of the same value as the bullion from which the cost of coining—say one grain—has been deducted. To make this clear, assume that the dealing is direct between the holder of bullion and the Mint; then take the case: A engaged on 1st February, when he could get 113 grains of fine gold converted into a sovereign gratuitously, to pay B 100 sovereigns on 1st March; but on the 2d February intervening a seignorage is charged, and one grain of fine gold is taken by the Mint for every sovereign coined in the kingdom; coinage being a monopoly he sends the same weight of standard gold necessarily before as after the imposition of the seignorage to get from the Mint 100 sovereigns, namely 113 × 100 = 11,300 grains. With the 100 new sovereigns he therefore equitably discharges his debt to A on 1st March in the 100 sovereigns which cost him the same amount of gold, and are of the same *current value* as the sovereigns coined before 2d February when no seignorage was charged.

The 100 new sovereigns, containing 11,200 grains of fine gold, cost A precisely the same quantity of fine gold as 100 sovereigns, when no seignorage was charged, namely 11,300 grains. He incurs the same expense in paying 100 new as in paying 100 old sovereigns; he therefore holds them to be to him of the same value; he could pay 100 new sovereigns for 40 quarters of wheat with no more facility than he could pay 100 old sovereigns on which seignorage was not levied. Neither could any other dealer. B gets the 100 sovereigns, and he gives A no less of the commodity he sells than the contract implied; and it is evident that C could offer B no more new or old sovereigns than A offers on the ground that the sovereigns new or old differed in value; so prices would, as far as this transaction was concerned, remain unchanged. But B in possession of the new sovereigns is in the same position as A; he gets or he gives the same amount of bullion, or of any other commodity for 100 coined sovereigns as before seignorage was charged. This argument holds wherever sovereigns are the current money.

If the 100 new sovereigns are melted down into bar gold the value, acquired by the Mint manufacture, is destroyed, precisely as the value of the fashion of the gold case of a watch is destroyed under the same operation.

---

* Ibid. p. 336. The Bank charge was 0·48 per cent., it is now 0·16 per cent., so it is equal to interest at 3 per cent. for 20 days: or for 7–8 days when money is at 8 per cent., as the days vary inversely as the rates of interest.

† Ibid. p. 320–4.

The *fine gold* in 100 old sovereigns amounting to 11,300 grains would sell for more than the 11,200 grains of *fine gold* in 100 new sovereigns; and the values would necessarily vary with the weight of gold. The value of gold coin varies as the value of gold in any other form varies according to its usefulness and the demand for it in that particular state; therefore, if as much gold coin exists as is required at a given place and time, to coin more is a waste of labour. It is labour for which no one will pay; and then gold acquires no additional value by coinage beyond that of bullion stamped authentically as of a given fineness. With a seignorage of one grain, coin like every other article in use, has an average price, of which the seignorage constitutes a part. The dealer cannot under such a system treat the new sovereign as bullion, nor melt it down with profit, unless it becomes worth as much or more as bullion than it is worth as coin. Thus one object of the charge is attained.

As far as the future, or as any current *transaction* is concerned, contracts can be made in new sovereigns as easily as in old sovereigns; and it has already been shown that contracts to pay pounds of money after seignorage is charged can be met only by the payment of the same weight of gold as was required when coinage was gratuitously executed, while the same number of coins will retain as coin the same value and the same power in the market.

The value of money as a medium of exchange is not necessarily expressed by the cost of the material of which it is composed—by some of the witnesses before the Royal Commission called "intrinsic value." The intrinsic value of a five-pound Bank of England note—that is the cost of the paper and the printing—is about three tenths of a penny; yet if rendered by legislation inconvertible, to-morrow, as it was in 1796, the value of the bank note as a medium of exchange and a measure of price is very different from its "intrinsic value." So long as it is accepted by buyers and sellers as money, while the same demand for money exists, while the same amount of money is in the market, and while money exists in no other form, its utility sustains its value.

If coining were free the additional value of coined over bar gold would be determined in the market; it would be limited by the cost of production.

Under a state monopoly the charge for seignorage can be pushed much further; but if pushed beyond a certain extent it will be followed by depreciation of the standard coin.

If the mint should coin 1,000,000 sovereigns of 100 grains each, and take from the proffered 113,000,000 grains of fine gold, 13,000,000 grains for seignorage, these would leave in the bullion market the materials of 130,000 new sovereigns of 100 grains each; so that instead of 1,000,000 as many as 1,130,000 new sovereigns might be made, which must fall in value if when thrown on the market, the demand is not augmented in the same ratio as the supply.

There is therefore a limit to the amount of seignorage that can be levied without producing depreciation of the currency; and this is evinced by the rise of prices that has resulted from any large diminution of the amount of the precious metals in the coins current, just as prices rise when the same amount of labour produces greater quantities of silver or gold.

Under a seignorage of one per cent. the gold saved will probably not be coined; it will, on the estimated aggregate of 80,000,000*l.** of coin not exceed the gold of 800,000*l.* to be added to all the other gold in the world, in the form of plate, currency, and bullion, of which it will form so small a portion that its effect on prices in the bullion market may be safely neglected, while bank notes continue everywhere in circulation, while the Bank of England holds stores of notes in the chests of its

* Estimate of Professor Jevons; Stat. Journal, vol. xxxi. p. 447.

Banking Department (27th January 1869) 9,234,395*l.*, and while the fluctuating yearly imports of gold from Australia and California amount to millions. Distributed over a few years the produce of such a seignorage would be a drop in the ocean.*

Under a mint charge the Bank will not send gold to the Mint unless the new coin is in demand, while it is allowed to issue notes or coins on corresponding amounts of bullion.

If the coinage is absolutely *gratuitous* the value of gold coins is proportional to their weight of gold; and 113 sovereigns each containing 112 grains of fine gold, are only worth as much as 112 sovereigns containing 113 grains of fine gold.† The lighter sovereign is therefore under this system depreciated; upon the other hand a *mint charge* of a grain on each sovereign coined implies a cost of 114 grains of fine gold on every sovereign of 113 grains manufactured. Under this seignorage 113 new sovereigns cost as much as 114 when the coinage is free; so an imposition of a seignorage of one grain appreciates the sovereign to that extent. But if the value of a grain is subtracted in one form (gold) and added in another (mint-work), the original value is sustained; for $113 - 1 + 1 = 113 =$ value in grains of fine gold. To maintain the "standard of value" in England unchanged the mint-charge must be deducted from the gold in the sovereign.

It was proposed to the Royal Commission to charge a seignorage of one per cent. (·010) on the gold coin, equivalent to about $2\frac{1}{2}d.$ on the sovereign; the charge now on the £1 of silver coinage ranging from $14\frac{1}{2}d.$ to $21\frac{3}{4}d.$, from 6 to 9 per cent. according as the market price of silver is higher or lower.‡

This seignorage will suffice to pay the entire cost of a perfect system of fine coins; it will cover the bank charge; it will enable the Mint to replace the worn sovereigns, and relieve holders from an inequitable penalty; it will be an effectual cure for the "wanton though criminal melting down" of our coin, of which Locke even in his day complained; it will reduce the weight of fine gold in the English sovereign to the weight of a twenty-five franc gold piece; and, leaving the value of the currency the same as it was before seignorage was charged, will not in any way affect past or future contracts to pay or receive sums of money in England.

To liberate the nation from the cost of a gratuitous coinage—which has many inconveniences, is open to many abuses, and can be justified on no principle—seignorage must be levied; and unless it be taken in the form of a proportional deduction from the metal of which the gold coin is com-

---

* This chapter was written early in the year 1869.

† For evidently $113 \times 112 = 112 \times 113$ grains of gold. This is well argued by Locke in further considerations concerning raising the value of money, Works, 11th ed., 1812, vol. 5, pp. 139–207: "I have spoken of silver coin alone," he writes about 1690, "because that makes the money of account and measure of trade all through the "world; for all contracts are, I think, everywhere made and accounts kept in silver "coin. I am sure they are so in England and the neighbouring countries. Silver "therefore, and silver alone, is the measure of commerce. Two metals, as silver and "gold, cannot be the measure of commerce both together in any country," pp. 150, 1. He asks, whether that workmanship which can be had for nothing has or can have any value? Whether whilst the money in our Mint is coined for the owners without any cost to them our coin can ever have any value above any standard bullion? Whether, whilst our coin is not of value above standard bullion, goldsmiths and others will not * * melt that down * * ? Whether the only cure for this wanton though criminal melting down our coin be not that the owners should pay one moiety of the $16\frac{1}{2}d.$ which is paid per pound troy (of $62 \times 12 = 744$ pence) for coinage of silver which the king now pays for? Whether by this means standard silver in coin will not be worth more than standard silver in bullion? p. 199.

‡ A pound troy of standard silver is coined into 66 shillings, of which the metal is worth from 60*s.* to 62*s.*, according to the market price of silver.—T. Graham, Master of the Mint. Report of Royal Commission on International Coinage, Appendix, p. 228.

posed the value of the currency will be changed. The change advocated will be advantageous to all classes in the kingdom.

To make the sovereign and the 25 franc-piece international coins, circulating indifferently in either country as interchangeable values, the seignorage must be the same in France as in England. Some contend that the cost in France is now virtually one per cent. Upon the hypothesis that the French charge—reckoning gold taken and the interest lost by delay—should be less than the seignorage, the equilibrium would be deranged just as it would by a difference in the weight of gold. This may be made clear by putting the reasoning in the form of an equation :

new sovereign of 112 grains of fine gold + 1·18 grain for mint work and bank charge.

= *in value* old sovereign of 113 grains of fine gold + 0 for mint work + 0·18 grain bank charge.

= in value a 25 franc gold piece of 112 grains + x grain for mint work and charge for delay ;

provided x be neither more nor less than 1·18 grain of fine gold.

This equation clears up the puzzling dilemma which Sir John Lubbock set before the Royal Commission,* and which they have given in their report. It is quite true that if the seignorage should be *less* in France than the charge to be imposed in England the value of the international coins will to that extent be reduced in England; if, on the other hand, the seignorage be really raised in France above its present charge the value of the gold coin there will be raised above its present value in that country.

I conclude then that the imposition of a mint charge to the extent proposed at the Paris conference, and its abstraction as seignorage, if the seignorage were everywhere the same in the countries of the convention, would have no sensible effect on the English sovereign as a measure of value either in those countries or in home transactions.

The amount of gold that can be taken as seignorage without affecting a coin's value as current money has a limit ; it may exceed one, but can scarcely be more than three per cent ; it should cover the cost of sustaining the weight, form, and purity of the metallic money, as well as of manufacturing gold coins of the finest quality as works of art. Money may thus be made an effectual means of cultivating the sense of the beautiful in art and of teaching decimal arithmetic.

We can coin the sovereign of the same weight and fineness as a 25-franc gold piece. But when that is done, will the question of coinage be settled ? I say, emphatically, No. The unit of coinage will not be a unit of weight, and the change will not give us the best decimal money of account.

2. *Maintenance of the coinage.*

It is necessary to sustain by settled provisions the standard weight of any international money. Gold wastes away less than silver as it is unassailable by ordinary chemical agents, but it loses yearly by wear ; and the less the weight, the greater the surface, the more rapid in proportion is the loss by attrition, for the same amount of work done.

No existing system grapples with the fundamental question of recoinage so as at the same time to prevent the weight of coin from falling below a minimum limit, to protect nations against the derangement of a great recoinage, and to insure the last owner from the infliction of an unjust penalty.

---

* On International Coinage ; Report, pp. xiii, xx.

In France no law regulates the weight at which the gold coin ceases to be a legal tender; *aucune loi n'a déterminé le poids au-dessous duquel une pièce d'or perd son cours forcé.**

The United States have "no legal limit of wear." Belgium does not receive gold coins at the treasury reduced more than ·005 of their weight below their tolerance, namely, ·002. Italy has the same limit.

This precaution only repels the coin from the treasury. England now takes certain precautions; gold coins, less by ·0063 than the standard unit weight, if taken to the Bank of England, or offered to the revenue departments, are cut and cannot be reissued. The loser has, however, by paying 4*d.* a sovereign, 6*d.* for two half sovereigns, the option of getting coins of at least legal weight for his cut pieces from the Bank of England; thus at this rate the loss on sovereigns is $1\frac{3}{5}$ per cent., on half sovereigns $2\frac{1}{2}$ per cent. On large amounts the loss is about 1·69 per cent. on light gold; as only 77*s.* $6\frac{1}{2}$*d.* an ounce is given by the Bank for the metal, and this loss of price, with the loss of metal, amounts to something like 4*d.* a 1*l.* on sovereigns and half sovereigns taken together.† It is a heavy item of loss; and in the year before last, on the light gold sent to the Bank of England, the loss of one bank came to 6,716*l.* The loss was at the rate of 0·157 per cent. (or ·001571) on all the gold sent to the bank; and 1·363 on the light gold.

Thirty-five to 40 per cent. of the sovereigns and half sovereigns paid into one bank in London were light, while of the gold coins paid into its branches 40–50 per cent. were light, and below the legal tender standard.

By the estimate of Professor Jevons, one in every third sovereign in circulation in England is below the legal weight.‡

The banks, as a general rule, have to take coin, as it is paid to their customers' accounts, at the full nominal value it had in circulation; and they are placed in this cruel dilemma: they have either to submit to a dead loss, or, knowing it is no legal tender, to circulate or keep back the light gold, at some sacrifice of interest, until it can be sent again into circulation. How this is accomplished nobody is particularly interested in clearing up. It is a mystery; but it has been ascertained that the lean kine usually find their way into the green pastures of England or the mountains of Wales, while the fat kine wander away, and fall by the pure accidents of commerce into "the melting pots" at home or abroad. Whoever wants sovereigns to send abroad, naturally procures them of at least legal weight from the Bank of England.

As 20 franc and 10 franc pieces are smaller than sovereigns, they wear away for the same work more rapidly. But of their actual state no returns have been published. The States in the convention, do not engage, it is true, to accept each others coins after they have fallen ·7 per cent (·007) below the standard weight. This is all, and this we have seen is not enough. The only certain measure for withdrawing light coin from circulation is, for each state to receive back legitimately worn coins at the initial value, and to exchange them for coin of the legal weight. No charge can then be made for recoinage; so, to be self-sustaining, the cost of renewal in perpetuity must be levied once for all on the new coin created at the time of its conversion from standard gold into money.

Under the present system the exchanges apparently give little intimation, so long as enough coin of full weight can be procured for foreign export.

Light coin must remain in circulation until public opinion calls aloud for a recoinage at great inconvenience, as well as at a heavy cost: that is the dark impending cloud. There is the alternative which is in use in

---

* International Coinage Report, Appendix, p. 244, and the pages following.

† See Table X., p. 277.

‡ Journal of Statistical Society, December 1868, p. 456, vol. 31.

England, where a light sovereign, after remaining an indefinite time in circulation, and after passing through a thousand hands, is delivered up at the Bank of England, and cut, the owner incurring a fine of *fourpence*, for all the loss it has incurred in metal and value, inasmuch as it is impossible to recover from each successive owner his adjusted share of the wasted coin.* The fine on two light half sovereigns is 6*d.* by the bank estimate.

There is a third course open, and it meets both the exigencies and the equity of the case. It preserves the coin perpetually in its integrity. It consists simply in charging the cost of construction and reintegration on the coin itself. It is applicable to every nation; but to show its operation, I take this country. Here if the Bank of England, instead of charging something less than a halfpenny on the metal of every sovereign before it is made, and 4*d.* on it when it is cut, levy the same sum on it at the date of its issue, say 4*d.* 38, the charge of 1*l.*·825 per cent.† by the Master of the Mint's estimate, will if invested in a coinage fund at 3 per cent. compound interest, provide for all the recoinages in perpetuity, and for the loss of gold by wear. The coin falling in only passes through the Bank and the Mint, again to be launched into circulation in all the freshness of youth. As the coin wastes and loses value yearly, the fund grows, and at the end of the period the growth on the fund balances the waste.

Colonel Smith, and Mr. Graham the Master of the Mint, one of the most eminent chemists in Europe, whose recent loss science deplores, first called attention to this view; they set down the cost of making the first sovereign at a halfpenny (or £·0021); they assume with Mr. Jevons, that at the end of 18 years,‡ the average sovereign will have fallen *below* the legal weight, and will have lost 1½*d.* of its gold (or £·0063); to replace this lost metal, and to recoin the second sovereign in succession, will cost 2*d.*; the same charge will recur on this estimate at the end of every 18 years. Now the present value of the halfpenny payable down (£·0021) and every 18 years ever afterwards, is by their estimate, reckoning interest at 3 per cent., 1¼*d.* (or £·0051); and the present value of all the gold to be periodically replaced is 2⅐*d.* (or £·0089); the value of the whole of the two series of fines for ever is thus by their estimate nearly 3½*d.* (£·014.)§ The two half sovereigns in circulation cost apparently for coining and wear three times as much as the sovereign; for they fall below the legal weight in less than 10 years.§ The small 20 franc and 10 franc gold coin labour under the same disadvantage.

The cost of coining varies with the quantity and the size of the pieces, so does the loss by attrition; but let it be assumed that the mean cost of coining gold, including the bank charge for loss of interest, will be at the rate of £·0027218; of restoring the lost gold £·0081378; then the present value of these periodical payments, commuted once for all, is £·01818 nearly; that is $\frac{1}{55}$ part of the weight of gold, or one out of every 55 coins. Whether this charge, which is undoubtedly sufficient to cover the cost of sovereigns, would also cover the cost of the smaller coins, experience and expert Mint masters alone can determine.

An example will show more clearly than any description, the operation of the principle in practice.

---

* By the Queen's proclamation her subjects are required to "cut, break, or deface" sovereigns of less weight than 122·5 grains, half sovereigns of less weight than 61·125 grains, dated June 3d, 1842.

† 100 × 4·38 pence = 438 pence = £1 16*s.* 6*d.* = £1·825.

‡ After this was written I obtained from the Bank of England data for more accurate determinations of the rate of wear and of the cost of sustaining the coinage, but these numbers serve well enough for the argument. *See* Introduction to Gold Coin Circulation Tables, pp. 261–8.

§ See Jevons in article above cited, and return to Order of House of Commons, article "Gold currency," dated 28th June 1869.

Assume that 11,000,000 pieces of any kind are to be coined ; I take for illustration sovereigns, merely to fix our ideas ; the bar gold is sent to the mint in the exact quantity required ; and the gold is returned in the shape of 11,000,000 sovereigns, at a cost of 200,000*l.*, which is paid at once to the credit of the coinage fund,

Of the 200,000*l.* there is paid
for the coinage of 11,000,000 pieces 29,940*l* ; which being deducted,
leaves 170,060*l.* ; to be invested at 3 per cent. compound interest ;

and this yields of interest in 18 years 119,455*l.*

Then the coin returns for recoinage which has lost of gold 89,515*l.* ;
and with the cost of the coinage = 29,940*l.*

amounts to 119,455*l.*; absorbing all the interest, but leaving 170,060*l.* still invested in the fund to maintain for ever the 11,000,000 new sovereigns in their integrity.

It is scarcely necessary to say, that in practice the pieces return at irregular intervals, and that the wear and cost vary under a great variety of circumstances. The cost I have assumed is higher than that given by the masters of the Mint. I have shown, at page 265, what the cost would be under the existing system.

It is probable that an international coinage could be well sustained under this charge ; and it will be observed, (1) that in England the reduction of the standard from its exceptional scale of $\frac{11}{12}$ fine, to that of $\frac{9}{10}$ in general use at other mints, and unanimously adopted by the Conference in Paris, will supply out of the bar gold used in coining 11,000,000 existing sovereigns of full weight, the whole of the fine gold required to make not only the 11,000,000 sovereigns, but the 200,000 more of the new standard ; so as thus to constitute the fund without any charge to the state ; and as in future the holders of bar gold must send of the new standard gold the weight of 11,000,000 sovereigns ; and must pay besides 200,000 sovereigns to get the 11,000,000 coined, the value of the new coin will be the same as the value of the old coin, so far as the value depends on the cost of production ; for the same amount of fine gold will be sent then to the Mint as is sent now to procure the same number of sovereigns. And to each person holding a new sovereign the gold in the fund will virtually belong, as it will be there to secure him against the losses from light coin to which he is now exposed. The same reasoning will apply to ten-gram Victorias.

Under this system the price of bullion will be limited ; it will fluctuate as the demand and supply of coin and of bullion respectively vary ; but in the normal state 108 Victorias of *ten grams* each will purchase 110 decagrams of standard gold ; and the price of 110 decagrams cannot fall for any time below 108, nor rise much above 110 Victorias, for obvious reasons. For on the one hand the holder can get 108 Victorias for 110 decagrams of standard gold from the Mint ; and on the other hand if the price in coin, of bar gold rises till it touches 110, the 110 coin of full weight will contain 110 decagrams of gold ; there will only then remain to give it the value of bar the cost of its conversion. If the coin is light, in this latter state of the market only, when coin is only worth its weight in bullion, can the price of bar gold rise to any extent, or until the fine metal in the 111 or more light Victorias exceeds 110 decagrams in weight. And it is only when this limit is reached under a mintage that coin can be melted with profit. When the coinage is gratuitous, that is, when bar gold is worth its weight in coin, a slight fluctuation in the price of bar gold renders it profitable to convert the coin, provided that it is of standard weight, into bullion ; while worn coin is protected by its weakness and lightness from destruction.

3. *How gratuitous coinage began in England.*

The coinage of England has been depreciated at various times. And our famous *pound* (*libra*) wears indeed a misleading air about its look. The very name recalls its fallen condition. Instead of a loyal pound of any precious metal it now represents only the one third part of a pound troy of silver, and only $\frac{1}{46 \cdot 725}$ of a pound of the present standard gold. The scales determined what a pound meant down to the reign of Edward I.; but to answer his celebrated question; "what is a pound?" in the House of Commons Sir Robert Peel had to hold up a "sovereign."

But all these things are relative, and in the presence of the International Congress, I dare venture to assert, that English money has been maintained in a state of integrity which has been rarely equalled in other states. Thus M. Denis has shown that at the French Revolution the livre of Charlemagne had dwindled down to a nominal *livre*, containing 1–78th part of the silver in the standard from which it was drawn. From the livre the franc is derived.

The reigns of the Stewarts are not the brightest in the financial history of England. And it was in the reign of Charles II. that the statute passed by which Ruding says it was enacted, that the "whole "expense of coinage was to be defrayed by the State." This is only correct in a qualified sense. The statute "for encouraging of coinage" enacts, that any person whatsoever, who after December 20th, 1666, shall bring "Crown or standard gold" to the mints, shall get it assayed, melted down, coined; and shall receive in exchange for it, without any charge or diminution, a pound troy of the current coin of the same standard; the same for silver. By a special clause, not unnecessary then, the gold and silver so brought into the Mint were exempted from confiscation. The preamble as the ground of the measure asserts two things: (1.) "it is obvious that the plenty of current coins of gold and silver of "this kingdom is of great advantage to trade and commerce;" (2.) For the increase of which his Majesty had been pleased out of his revenue to bear half the charge of the coinage of silver money. To prevent this charge to the King, and to encourage the coinage of gold or silver in mass or in manufacture brought from home or from abroad, they granted him certain duties upon wines, brandy wines, strong waters, vinegar, cyder or beer, "imported from any parts beyond the seas, or Scotland."*

The cost of making coin had hitherto been borne by those who used coin; and none of the great sovereigns or parliaments, neither William I., Henry II., Edward I., Edward III., Elizabeth, nor Cromwell, had attempted to throw the charge of coining on any other classes of the community than the merchants or "goldsmiths," who sent the metal to be manufactured for sale. The charge for the rude gold coinage had formerly varied; but it had rarely exceeded 2·6 per cent., and remained steadily at that figure for 40 years, until it was abandoned in 1666. The nation had been plunged at the close of Clarendon's administration into a war with Holland and France; the plague and the fire of London caused disquietude; and coin was hoarded, or exported to France, Holland, and India, where gold and silver were in demand. The measure was completely unsuccessful in its object; the same dearth of money remained, as long as the circumstances continued. If free coinage encourages the birth of coins, it increases their destruction to a still greater extent. The new coins were no sooner made than they were hoarded, as they

* 18 Charles II. cap. 5. §§ I, V, and VI.

always are in times of disquietude, or melted down into plate,* or exported by "the goldsmiths and bankers," who bought dollars at 4*s.* 3*d.* a piece, and instead of sending them to the Mint, as the framers of the Act expected, sent them away as fast as they came to hand to France or to other countries, where they sold for 4*s.* 10*d.* The light coin, as happens in the present day, remained in circulation. "Of his now Majesty's coin," declaimed Lord Lucas in the House of Lords,† "there appears but very "little; so that, in effect, we have none left for common use, but a little "*lean coined money*, of the late three former princes." The measure of free coinage was based on a fallacy, and failed then as it has failed since. It dispatches more coins, when bullion is in demand, than it ever creates; at other times it produces no sensible effect, as bullion is always sent to the Mint when good coin is wanted, and lives where it is not superseded by paper or by light coins.

Locke condemned the system. The fallacy was seen through at the time by one of the soundest commercial writers of his age.‡

Sir Dudley North asserts that the country gentlemen were deceived at the time; rents had fallen, and they believed, he declares, by a profound mistake, that if plenty of money was made, they must have of course a share of it.§ He does not notice the protection the Act offered against the importation of spirits and beer from Scotland and Holland; though this Parliament was thoroughly alive to that aspect of the case; for immediately before the Bill passed, it had prohibited the importation of cattle from Ireland and other parts beyond the seas, by enacting that such importation is and shall be adjudged a "public and common nuisance."‖

The nature of free coinage is shown by this Act; the expense under it remains, but it is transferred from the owners of bullion and coin to the shoulders of other people. The consumers of wine, spirits, cyder, beer, and vinegar then had to pay for the manufacture of the article in which "the Goldsmiths who gained by the melting trade," trafficked. For equally valid reasons the goldsmiths might have been taxed to uphold a public brewery.

---

* Davenant says, more plate was wrought for use in families during the years 1666–88, than had been fabricated for 200 years before. Works, vol. I. p. 370. By his estimate made in 1698, of 18,500,000*l.* in the Kingdom, there might be hoarded 9,240,000*l.*, leaving 9,260,000*l.*, with the currency of "Goldsmith's notes," to carry on the "Universal affairs of this nation," p. 441.

† February 22d, 1671, Ruding on coinage, vol. III. p. 317–8.

‡ Sir Dudley North explains the passing of the Act in his own way: "The Crown got "by the coinage duty; the Goldsmiths who gained by the melting trade were advancers "to the Treasury, and favorites." Life of Sir Dudley North, p. 179, cited by Ruding, vol. III. p. 315. "He was infinitely scandalised at the folly of this law, which made bullion and coined money par." The judicious Ruding says: "The inexpediency of the "provisions have been proved not only by his reasoning, but by fatal experience also." vol. III. p. 372.

§ "I call to witness," says a writer, "the vast sums that have been coined in England "since the free coinage was set up. What is become of it all? Nobody believes it to be "in the Nation, and it cannot well be all transported, the penalties for so doing being so "great. The case is plain—the melting pot devours it all. The rather, because that "practice is so easy, profitable, and safe from all possibility of being detected, as everyone "knows it is. And I know no intelligent man who doubts but the new money goes "this way. Silver and gold, like other commodities, have their ebbings and flowings: "upon the arrival of quantities from Spain, the Mint commonly gives the best price; "that is, coined silver for uncoined silver, weight for weight. Wherefore it is carried "into the Tower and coined. Not long after, there will come a demand for bullion, to "be exported again. If there is none, but all happens to be in coin, what then? Melt "it down again; there's no loss in it, for the coining costs the owners nothing.

"Thus the Nation hath been abused, and made to pay for the twisting of straw for "asses to eat."

Discourses upon Trade, London, 1691, p. 18, cited in Ruding's Annals of the Coinage of Great Britain, vol. III., pp. 371–372. These discourses are ascribed in his life to Sir Dudley North.

‖ 18 Charles II. c. 2.

In the year 1816 the mintage on silver coin was reimposed, and it was thus put on a sounder footing. The Mint buys silver at the market value; coins it; sells it coined at 5*s.* 6*d.* an ounce; and restores the defaced by new coin. The average cost of standard silver in the ten years 1858–67 was 5*s.* 1½*d.* an ounce, or 3·073*l.* per lb. troy; and the annual surplus on the silver coinage of 355,472*l.* was 18,304*l.*, after providing for the annual replacement of 102,740*l.* of worn coin, which* weighed only as much as the silver coined in 89,012*l.*, and had thus when withdrawn from circulation by the Bank of England, to be sent to the Mint, lost 13·362 per cent. of its original weight.

The Mint has a profit, after deducting the cost of the coinage of silver; but the gain is reduced by the loss on worn coin; of which it is only called apparently to replace a certain proportion, otherwise it might gain little by a seignorage of 7 per cent. Whatever may be the case, the principles of a first charge for making and for replacing for the future the silver coin, is sound.

Not so the coinage of gold. This metal was still to be coined for nothing. The wisdom of the authors of the Act is evident on the face of it. When it passed in 1816 the average price of the gold in a sovereign was 24*s.*, yet the Act made it a misdemeanour, to be punished by imprisonment, to receive or pay more than 20*s.* for this coin, as this was declared to be "its true lawful value."† 7,137,710*l.* in sovereigns and half sovereigns were forthwith issued from the new Mint, but they suddenly disappeared, and the issue was stopped for nearly two years, until cash payments were resumed in 1821. This was a foretaste of what has happened since. The Mint Committee of Privy Council in the report on which the Act was based, endeavoured to fix on a rate to protect the new silver coins from "the danger of being melted down and converted "into bullion when the market price of silver rises."‡ Why was not the same protection thrown over gold?

4. *Current Coins should be simple weights of the precious metals.*

Money to be a just measure of values takes for its basis a given weight of gold or of silver; and the most eligible measuring unit is a weight in common use for other purposes. It was a *pound* of standard silver, an *ounce* of silver, a *pennyweight* of silver,§ when that metal was the measure of values. The size of units of all kinds should be taken so as to express the quantities to be measured with sufficient accuracy without fractions in numbers easily comprehended by the mind. When the units are no longer simple weights they still serve as money, they are counters, and if they are called marks, napoleons, dollars, gold-francs, or any arbitrary name the connexion between value and weight of precious metal not being readily tested is easily lost. The silver, the gold, in difficult times, before the currency of notes, dwindled until it almost disappeared in debased coin. This financial legerdemain M. Michel Chevalier ascribes too exclusively to the "kings" of the middle ages, who indeed in France reduced the livre of silver to a hundredth part of that weight, and in England pared down the silver penny to a third of its original penny-

---

* The Mint in the 10 years 1858–67 coined 12,926,262 ounces of standard silver; of which 3,236,802, at a cost of 1,027,400*l.*, were drawn from worn coin; while 9,689,461 ounces were bought in the market for 2,481,548*l.* The silver in the market cost ·25611*l.* an ounce; the silver in the worn coin ·31741*l.* Deduced from Return to order of the House of Commons, 18th June 1868, No. 340.

† 1816. 56 Geo. III. c. 68. s. 13. M'Culloch's Commercial Dictionary, articles "Coin, Bank." Ruding on Coinage, vol. iv. pp. 148–152.

‡ The Report is published in the Annual Register, vol. lviii. p. 439–441.

§ The Anglo-Saxon *penny* was a pennyweight of silver: it was thus in silver nearly our threepenny piece.

weight.* He justly denounces the "despoiling doctrine" that gave "kings" the divine right to "falsify money;"† but these "kings" of the dark ages either openly reduced the weights of coins, or in them surreptitiously substituted base for precious metals; they had not at hand bank notes, which have since been discovered, are so easily manufactured in profusion, and are so readily debased by rendering them inconvertible. This financial sleight of hand is now made easy.

And unhappily the practice of circulating base money is not confined to kings nor to the dark ages. It has been practised by governments of all forms with the sanction of nearly every nation. The French Republic at its birth flooded the nation with assignats. The English legislature for twenty-six years (1797–1823), relieved the Bank of England from paying its notes in cash. At the present hour five of the great states of the world circulate debased paper money, Russia, Spain, Austria, Italy, and the United States of America. The United States paper is at this time depreciated 25 per cent., and is liable to violent fluctuations. An eloquent speech of senator Sumner sent it down at once as low as 30 per cent. An orator's breath thus carries up or down this paper money, upon which contracts turn.

Copernicus, who divined as clearly the true system of money as his genius divined the system of the heavens, opens his remarkable treatise by declaring that, innumerable as are the evils which ruin kingdoms, the following four are the most fearful,—civil war, pestilence, famine, and base money. The first three are evils evident to everybody, the evil of depreciated money is only evident to a few, who take it seriously to heart, because it does not by a blow, but imperceptibly, like a slow poison, subvert commonwealths.‡

It is impossible to exaggerate the evils of a currency of base coin, and still less of inconvertible paper; it makes the measure of value arbitrary, and renders contracts extending over any length of time difficult, if not impossible; gold is swept out of circulation, credit is sapped at its foundation; violent fluctuations in prices are inevitable as the equilibrium is unstable; stocks can have no fixed value; government securities are depreciated, as it is impossible to be certain whether the public dividends will be paid in paper worth its nominal value in gold, or in paper worth half that value, or in paper worth nothing; the creditor is at the mercy of the state debtor, which can, under the cover of inconvertible paper, hide its most flagrant delinquencies. The present unsettled credit of Europe is mainly due to the fact that the rouble in Russia, the florin in Austria, the lira in Italy, the dollar in America, are not given weights of the precious metals, but promises to pay, which, like Iago's purse, may be something or nothing, full or empty, at any distant date.

The issue of debased money, which inconvertible paper inevitably becomes, is the worst financial resource to which a nation in war can resort; it is a sweet and poisoned beverage in the hand of an athlete.

And the only remedy for this dangerous evil is economic practical education: the currency of inconvertible notes will we may hope not long be tolerated when the people understand by daily use that standard

---

* The Tower pound of silver—of 240 pennyweights—(= 225 Troy pennyweights) $\left(\frac{222}{240}\text{ fine}\right)$ was coined into £1 of 240 pence at the Conquest; and in Elizabeth's reign (1560) the Troy pound was coined into 62 shillings = 744 pence. Since the year 1816 a Troy pound of silver has been coined into 66 shillings = 792 pence.

† La doctrine spoliatrice qu' avaient mise en honneur les rois du moyen âge, et par laquelle ils s'arrogeaient le pouvoir de falsifier les monnaies.—*Journal des Economistes*, tome XII. p. 200.

‡ Traité de la monnaie de Copernic, for the publication of which we have to thank M. L. Wolowski, Guillaumin et Cie., p. 48.

genuine money consists only of known weights of standard gold or silver, and find that promises to pay are snares and delusions unless they are kept. The issuing states suffer most from the currency of debased money, but they are not the only sufferers; the credit of all nations is deranged and the whole world will derive benefit from a sound international coinage to which all nations are parties.

5. *The ten-gram (decagram) of standard gold=the Victoria=the 25-shilling piece.*

The gram is a weight in daily use among the people of France, Italy, Switzerland, and Belgium; its multiples are in all their shops and houses. A coin of standard gold weighing ten grams could be appreciated and be tested by them at any time. The weight of a napoleon, of 6·4516 grams, or a 25-franc piece, of 8·0646 grams, is expressed in fractions, not easily comprehensible, while a ten-gram coin of standard gold is perfectly intelligible, and its weight is easily determinable. Under these circumstances no one can be surprised that Cobden's friend, M. Chevalier, one of the highest French economical authorities, should propose a *ten gram gold unit* as the basis of the monetary system of the world. The metric system of weights and measures will in the end be inevitably adopted, like the Arabic figures, by every civilized nation. That system is the real glory of France, which none can contest or deny, but the glory is incomplete so long as the measuring unit of value is not the gram, or the ten gram weight of standard gold.

Contracts to pay sums of money will be free, but on this plan the amounts will always be expressed in weights of gold, or in weights of silver if that metal be expressly specified in the bond. Thus the question of double standard will be solved, and the exigencies of China, India, and silver-circulating European nations may be consulted by a common silver coin in weight connected by a simple factor with the gold unit.

The ten gram gold unit of money necessarily differs from any of the units now in use; it will be a new international coin; but its scientific basis commends it to the philosophic minds of Germany, Holland, Scandinavia, and Italy; while it has accidentally strong claims on the three nations which coin the largest quantities of gold. France has in it a kind of paternal interest; it is the natural development of her scientific system of weights and measures. The English sovereign weighs almost exactly eight grams; and the passage to a ten-gram coin is easy, as the new coin decimally divided embraces two of the principal subordinate silver coins in use in England. A ten-gram gold coin is almost the exact equivalent of a six dollar American gold coin. The new scientific coin is a natural development of the English and the American coinage, corresponding in increase of weight with the increase of the existing quantity of gold and the increase in the values of commodities to be measured.

I will endeavour to show how the new unit is deduced directly from the basis of the metric system, and how readily it can be adjusted by slight variations of fineness to our own existing system of money.

All the units of the metric weights and measures are based on one fundamental unit, the metre.

The unit of weight is the *gram*, which is deduced from the weight of a cubic centimetre of distilled water at its maximum density. It would, therefore, be in strict analogy with this system to take *a gram* of standard gold as the unit of the measure of value; for then, as a cubic centimetre is the volume unit; the weight of its volume of water, the weight unit; that weight of gold, or a multiple of it, would be the unit measure of values. This would be simple, logical, and in strict accordance with the basis of the

metric system, which renders the passage from linear and superficial to cubic units, from cubic units to weights, so easy. The idea of weight is totally different from the idea of volume; but the two are connected by the intervention of water: so the idea of value is totally different from the idea of weight, but the two are connected by the intervention of standard gold. Then the unit of work—a kilogram lifted a metre in a second, and the measure of the value of that work would be alike connected with the metric system.

France could not make the gram of silver, as it was too minute in value, her prime money unit, and at the time the metric system was instituted gold was only considered a subsidiary to the silver coinage: by the law of the year XI, France made the franc of 5 grams weight, 9 tenths fine, her money unit: "*5 grammes d'argent, au titre de 9 dixièmes de fin,* "*constituent l'unité monétaire, qui conserve le nom de franc,*" are the words of the law. The franc remained the money unit in use until the gold discoveries threw for a time silver aside in France, which virtually has had the double standard. Debtors having the option of paying in silver or in gold, upon the assumption that 100 grams of silver are worth 6·4516 grams of gold, choose to pay in gold when that metal is depreciated, as they pay in silver when silver is depreciated. The five franc piece contains its 9-tenths of fine silver: the franc is lowered in standard now, as it contains only ·835, instead of ·900 fine silver. The franc is now a debased counter. The 20-franc gold piece, containing 6·4516 grams of standard gold 9-tenths fine, cannot be made in any way to square with the metric system; so that here France completely breaks down in carrying out her own sound principles into the most important of all the fields of their application. The monetary convention too, in which France was the leader, accepts the double standard, with its complications, and its incongruous assumption that gold is worth at all times $15\frac{1}{2}$ times its weight in silver. The *gold franc unit* (= 0·32258 gram) is justly pronounced by M. Michel Chevalier to be "complétement en dehors "du système metrique." He adds forcibly: "En sorte qu'il serait aussi "raisonnable de recommander au monde, pour l'unité de mesure des capa-"cités, le boisseau de Winchester ou celui de Cologne."* The Paris conference of delegates of 20 states made an unanimous declaration in favour of one gold standard, of which Mr. Chevalier approves; and he himself argues in favour of a return to the ancient principle of coining a given weight of the standard metal as the unit of value. It was *a pound of silver;* it should now be *a gram of gold,* or some of its decimal multiples. The gram of gold, he says, is too small for use; the *ten gram* piece of gold would be of a convenient size. It would be a larger finer coin than the twenty franc piece: and the five gram piece as well as the two gram piece would be larger, and more convenient for use than either the *ten* or *five* franc coins. Accounts could be kept either in the gram or the ten gram unit; and their decimal submultiples, according to the magnitude of transactions.

The principal commercial witnesses before the Royal Commission, and the commissioners themselves, attach the first importance to the fact, that contracts to pay in money should imply contracts to pay fixed weights of fine gold. Now it happens that the English sovereign does weigh, as it comes from the Mint, very closely on 8 grams; it may by the tolerance indeed exceed 8 grams. By simply adding only a small fraction of a grain ($\frac{1}{5}$ grain) to the alloy, leaving the fine gold precisely in its present quantity, we get the sovereign theoretically, as it is practically, 8 grams in weight; the half sovereign 4 grams; the half of this again 2 grams, worth a crown, and consequently the gram worth half-a-crown, an old favourite.

---

			20*s.* 0*d.*		25*s.* 0*d.*	

The English Mint could any day coin 8 gram sovereigns and all their sub-divisions down to 2 grams without any difficulty, and it could go a step further by coining a 5 *crown*, that is a *five and twenty shilling* piece of 10 grams (·9153 fine). It will be a new guinea; a guinea amplified, beautified, and decimally divisible into convenient subordinate units. The prime gold unit will thus be enlarged as the gold in use is augmented. We should have three subordinate units; the gram (*guilder*) occupying the first decimal place, would be the equivalent of the half crown; the decigram equivalent in value to the threepenny piece, and the centigram equivalent in value to the tenth of a threepenny piece = a cent = 1·2 farthing = ·3*d.*: so that 5 of the new cents would be of the same value as 6 of the present farthings = threehalfpence. The money of account of all denominations would be gold. Accounts of money and weights of gold would be represented by the same figures.

100 of the grand gold coins would weigh a kilogram; and as 1000 kilograms are a metric ton, 100,000 new coins would be a metric ton of standard gold.

If the mint assay and stamp kilograms of standard bar gold so as to guarantee the fineness, these kilograms of gold will be convenient forms of bullion, available for exportation, or for deposit in banks. A thousand kilogram bars weigh a metric ton; worth, while no mintage is charged, 100,000 of the great gold coins. A *million* of these coins (= 1,000,000) would weigh ten tons of standard gold, and be worth a million and quarter pounds of the present sterling.

The multiplication of pounds sterling by ·8 converts them into the ten-gram gold coin. The specific gravity of a new sovereign is 17·58, water being *one*, and this enables us under the metric system to pass from value to weight, from weight to volume.*

Accounts are now kept in England in four units, (1) pounds, (2) shillings, (3) pence, (4) farthings. Under the ten-gram gold coinage accounts may be kept in two columns. Thus the following tables (XI. and XII.) show

* Thus a cubic metre of standard gold containing 1,000,000 cubic centimetres would be worth 1,758,000 of the new gold coins; and a metric ton of standard gold would be $\frac{1,000,000}{17·58}$ = 56,883 cubic centimetres = a bar 1 decimetre deep and 8 decimetres long by 7·11 decimetres wide.

the expenditure of different countries and its proportion to the population under the two systems.

To illustrate the new *ten-gram gold coinage* I give in the annexed tables the revenues of some of the principal states of the world in their present coins, and in the proposed international coins.

The annual state expenditure of 432 million people was 456 million of these ten-gram Victorias (5 crown pieces), that is a little more than a Victoria a head, or more exactly one Victoria and 55 cents a head = one Victoria, 5 threepennies, and 5 cents = one Victoria, $5\frac{1}{2}$ old English pennies. (See Tables XI., XII., and XIII., pp. 278–280.)

6. *Changes in the English Coinage under the Ten-gram gold unit.*

The ten-gram unit of gold ·915 fine*, instead of ·916 fine, would contain exactly the same quantity of fine gold as $1\frac{1}{4}$ sovereign, worth five-and-twenty shillings in the present currency; and if the Mint and Bank cost of making and sustaining the gold coinage is fixed at 15, 10, or 5 centigrams of fine gold for every decagram, the fineness will be ·900 or ·905, or ·910: while the amount of fine gold taken as seignorage will be worth from 5*d.* to 3*d.* or to $1\frac{1}{2}$*d.* in the present currency, which will be as much a part of the cost of production as the expenditure at the gold diggings. The cost of producing 9 grams of fine gold is expressed in our currency by 24*s.* 7*d.*, so that if the Mint and Bank cost of converting ten grams of standard gold (·900 fine) into a coin, and replacing its wear, is expressed by 5*d.*; the value of the ten gram coin current is 25*s.*, of which it will be the equivalent so long as the customer of the Mint has to send 915 grams of fine gold, or its equivalent in money, for every 10 coins he gets, each containing 9 grams of fine gold.

At the International Conference suggested by the Royal Commission this question of a universal standard of fineness and of seignorage could be settled; and whatever the decision may be the change will cause but slight and temporary inconvenience in this country.

7. *Gold Coins.*

England can at once coin the sovereign of 8 grams of standard gold with the slightest possible inconvenience, and without changing its content of fine gold. The half sovereign will weigh 4 grams. A gold crown of 2 grams might also be coined.

The only new coin necessarily required is a fine five crown gold piece of 10 grams, which would probably in time get into circulation as a sort of new guinea, even if it were not at once stamped as the international coin. Large coins are generally more popular than small coins.

Once accepted as the international unit the 10 gram piece might with advantage become the basis of a decimal money of account for England; the gram of gold, the decigram, and the centigram being the subordinate units, to be represented with some of their multiples in gold, silver, and copper coins. The English standard gold coins under this system are the coin to be called Victoria or some other name (10 grams), the sovereign (8 grams), the half sovereign (4 grams), the crown (2 grams), and lower than this it is useless to go as the coins in gold become too small for use. The sovereign and the half sovereign in England might ultimately be replaced by the gold Victoria and its half. In France the Napoleon of 20 francs, still circulating—if brought into this system—would weigh 6·400 grams; it would in due time be superseded.

---

* The exact fineness is ·9153, but assayers cannot work to this pitch of accuracy.

8. *Silver Coins.*

Silver coins if they cease to be a legal tender will be under the single gold standard counters; there will be no inevitable restraint on their weight or fineness, and they need not be at first international.

In England the silver coins will represent the same proportions of the gold unit as those now in circulation; but a slight change in weight is required. The silver crown weighs 28·2759 grams ·925 fine, and contains 26·155 grams of fine silver. Now the mint purchases standard silver at rates ranging from 5*s.* 0*d.* to 5*s.* 2*d.**—say 5*s.* 1*d.*—an ounce of 31·1035 grams; so that if it coined silver without charge, the crown should weigh 30·594, the half-crown 15·297 grams. The half-crown now coined actually weighs 14·138 grams; the difference is the mint charge (1·159 gram). The fine silver in the half-crown weighs 13·078 grams. By making the half-crown exactly 15 grams and of the same fineness as the five-franc piece, namely ·900, it will contain 13·500 grams of fine silver; that is, it will weigh more by exactly 0·862 gram, than the present half-crown, and it will be better, as half the addition (·422 gram) will be in fine silver. The mint will still retain under this arrangement 4·59 per cent. of fine silver — one shilling in 21 — as the cost of coinage. Then the silver crown will weigh exactly 30 grams, the half-crown 15 grams, the florin 12 grams, the shilling 6 grams, the sixpence 3 grams, the threepenny 1½ gram; and there the silver coinage will stop. Five crowns will contain the same amount of fine silver (150 × ·9 = 135 grams) as six five-franc pieces.† A florin will contain nearly the same weight of fine silver, 10·80 grams, as the rupee, 10·69 grams.

This is only one of the ways in which the object may be obtained of making our silver coins simple multiples of grams of standard silver by varying the fineness. The French have the standard of ·900 fine for their five-franc piece, and the lower standard, ·835, for the franc itself and the other silver coins. By making the half-crown of 15 grams ·872 fine, it will contain the same amount of fine silver as it contains at present (13·078 grams), and the Mint will get its present profit. If the silver coin were of the same fineness as the gold, the one gram of gold would, at the common market value, purchase 15·5 grams of silver;‡ but as the expense of coining silver is necessarily greater than the expense of coining gold of the same value, the weight of fine metals in the gold and silver coinage should be in a lower ratio (say 1 to 15), to compensate for the difference in the cost of production.

9. *Bronze Coin.*

The silver threepenny piece represents a decigram of gold, and is the equivalent of 12 farthings of the present currency. The centigram of gold is the lowest unit of value recognized in the new system of account, and it may for the sake of brevity be called a *cent.* The United States' cent. is their lowest unit; it is worth nearly two English farthings, and is too large to express the graduated prices of articles of small value. The French centime, on the other hand, is too small a unit for general use in Europe; it is the fifth part of the lowest American unit; and only $\frac{2}{5} = \cdot 4$ of our present farthing. Now the value of the centigram of gold is the mean between the value of the American cent (2 farthings) and the French centime (0·4 farthing) $= \frac{2 \cdot 0 + 0 \cdot 4}{2} = \frac{2 \cdot 4}{2} = 1 \cdot 2$ farthing = 1 centigram

---

* Report on International Coinage. App., p. 228.

† In North Germany 8 dollars weigh more than 148 grams of silver, ·900 fine. In South Germany 14 gulden pieces are the same weight.

‡ 7·3225 grams of fine gold in 1*l.* purchase 113·1950 grams of fine silver, if standard silver ·925 fine is 5*s.* 1*d.* per oz. troy; consequently the ratio is 1 to 15·46.

of gold. This *cent* is a convenient low unit and is admirably suited to use all over the civilized world.*

The small centigrams of gold will be represented by bronze coin. The value of the copper coin was formerly expressed in the weight of metal, but this is no longer the case; the bronze in the English penny is worth about a farthing. The three coins in use are convenient counters; and the farthing and halfpenny are usually in accounts written as $\frac{1}{2}$ or $\frac{1}{4}$ of a penny. The ten-cent piece, now in use as a threepenny silver coin, will be conveniently supplemented by bronze coins of 1, 2, 3, 4, and 5 cents; the 5 cents being the half of the silver 10 cent piece would correspond to three halfpence of the present currency. The *cent* will supply a better graduated scale to express prices than the farthing, halfpenny, and penny, and popular demand will soon determine how many of each coin should be struck. Bronze coins of three sizes are now unnecessary, as no attempt is made to express value by weight. One type of coin—inscribed with one cent, two cents, three cents, four cents, and five cents may suffice. They will form part of the decimalized currency. I annex a scheme of the coins.

10. *Coins and their Signs.*

The money of account it will be borne in mind is, on the new system, in standard gold, and runs thus:

STANDARD GOLD UNITS OF ACCOUNT.

Signs -	₮	*s*	*d*	*c*
Victoria -	1 decagram	= 10 grams	= 100 decigrams	= 1000 centigrams.
Sol (*Halfcrown*)		1 gram	= 10 decigrams	= 100 centigrams.
(SOLIDUS or GUILDER.)				
Denier (*Threepenny*) -			1 decigram	= 10 centigrams.
(*Denarius* or *Denny* in short.)				
Cent -				= 1 centigram.

Every one of these four weights of gold may be employed as a measuring unit.

Call, after the analogy of "Guinea" the prime unit or decagram a *Victoria*, as it is the name of a principal gold field; then, where large units are required, ₮11·875 will be read 11 Victorias, 875 cents; or as we are accustomed to three units £ *s.* *d.* we may read ₮. *s.* *c.*; ₮11. 8, 75 = 11 Victorias, 8 sols, 75 cents; and on the continent where two units are preferred, 118 sols, 75 cents. For smaller sums cents alone suffice; for instance, we may say the price of a loaf of bread is 22 *cents*; of a pound of beef 30 *cents*.

Although the coined shilling only consists of eleven pennyworth of silver, it exactly represents in an account *twelve pence*, or the 20th part of a gold sovereign; and a penny, consisting of a farthing's worth of bronze, represents the value of the 240th part of a sovereign. So, under the gram system, half-a-crown in silver, weighing 15 grams, represents *one* gram of standard gold; a threepenny piece (10 cents) represents the tenth of a gram—or a *decigram* of gold; a bronze cent represents a *centigram* of gold. Value is invariably expressed in weights of standard gold, which are conveniently represented in tangible manageable silver and bronze tokens.

---

* "The division of the franc into 100 centimes is simply nominal * * In accounts we find $2\frac{1}{2}$ centimes practically set down as the lowest figure; balances under this amount being ignored, and over the amount counted for the full sou." [Seyd on Exchanges, p. 691.] The new cent is = $2\frac{1}{2}$ centimes. Mr. Yates, who has done so much to promote the introduction of the metric system here, shows that there is a demand for centimes in France, Italy, and Belgium, and for smaller coins in Asia; a half centigram piece meets this case; indeed milligrams may be represented by bronze coins. [See Eleventh Report of International Association, British Branch, Appendix, page 67. Paper by James Yates, F.R.S.]

The coins may be thus described: The four fundamental units are printed in **antique** letters:

Standard Gold:

Victoria - -	Weighing 10 grams (a new coin).	
Sovereign -	„ 8 grams	Existing coins to remain in circulation for a time.
Half Sovereign -	„ 4 grams	
Crown - -	„ 2 grams (a new coin).	

Standard Silver existing coins to remain in circulation, and to be gradually replaced:

		Grams of Gold.
Crown - -	Weighing 30 grams - -	Worth 2·00
Sol (*Halfcrown*)	„ 15 grams - -	„ 1·00
Florin - -	„ 12 grams - -	„ 0·80
Shilling -	„ 6 grams - -	„ ·40
Sixpence -	„ 3 grams - -	„ ·20
Denier (*Threepenny*)	„ 1·5 grams - -	„ ·10

Bronze Coins.			*Gram of Gold.*
5 cents - -	One type of coin with inscribed values. It is like paper money, into which intrinsic value of material does not enter.	(V.)	Worth ·05
4 cents - -		(IIII.)	„ ·04
3 cents - -		(III.)	„ ·03
2 cents - -		(II.)	„ ·02
1 cent - -		(I.)	„ ·01
½ cent - -		(½.)	„ ·005

Weighing 10 grams

(For a time the penny, halfpenny, and farthing to be utilized).

11. *Economies of a great Gold Coin.*

One kilogram of standard gold is now coined into 125 sovereigns,* and into 155 Napoleons. Under the ten-gram system it will be coined into 100 Victorias. (1) The expense of coining 100 pieces is less than the expense of coining 125 or 155 pieces. (2) The new coin is easily weighed wherever metrical weights are in use, as it is a round number of grams. (3) The surface of the large coins being less for the equal weight the wear is less. (4) The size is convenient, and the trouble of counting the coins is diminished. (5) The figures in accounts are fewer, and the arithmetical labour is diminished. (6) Large sums are readily comprehended by the mind when expressed in large units. (7) The half-sovereign is convenient in some cases; but to make it the largest coin of account would, for some of the reasons assigned above, be inexpedient. The inexpediency of a ten-franc unit is still more striking. The ten franc gold unit is on many grounds preferable to the gold franc unit, as Mr. Graham pointed out; but the coin in proportion to value would cost three times as much as the decagram, it would last half as long, and it would weigh 3·2258 grams.† The unit of value would not be a unit of weight, it would be 3·2258 grams of the French standard gold. This is a fatal objection to the ten franc unit as the scientific basis of a permanent system of money.

Silver coin contrasts in all these respects unfavourably with gold coin wherever large sums are in question. (1.) To represent the same value as 100 ten-gram pieces of gold weighing a kilogram, about 15½ kilograms of silver are required; more by 6 lbs. than a quarter of a hundredweight. To weigh it in scales is a task. Silver is about 29 times as bulky as gold of the same value. Its coinage in France is 3 or 4 times as costly. (2.) It is less easily carried, kept, concealed in dangerous places and times.

---

* Exactly 125·1846.

† According to the Master of the Mint the cost of making a sovereign is now 3 farthings, and it falls by wear below the legal weight in 18 (really 16) years; two half-sovereigns cost 6 farthings, and fall below their legal weight in 10 (really 8) years.—*Return to Order of House of Commons, dated 28th June 1869.*

(3.) The silver worth 100 ten-gram gold pieces in France is coined into 620 five-franc pieces, and in the same proportion the trouble of coining, counting, and manipulating is multiplied. (4.) The silver dollar is subject to similar objections; and (5), inasmuch as many figures increase labour, confuse thought, and increase chances of error, the 3,100 francs corresponding to 100 ten-gram gold pieces are five times more objectionable than the dollar as the largest coin of account. The franc at one time suited the small transactions of the French peasantry, and the big five-franc piece satisfied their eye, but large gold units are required now to measure the accumulating revenues and fortunes of the French people. Of all the primary monetary units in use in Europe the franc is the least, and on that account the worst.

Silver coin might therefore among the civilized nations of Europe and America be reduced to its place as a convenient representative unit, and in all the countries which like England enjoy the single gold standard the quantity of silver in silver coin is to a certain extent arbitrary.

But silver is still the standard in several countries; in India, in China, in Germany, in Holland, and in other nations with which England has very large commercial transactions, it constitutes nearly the whole of the coined currency. Silver has frequently to be transmitted to those countries; the Bank of England has also power to issue its notes against silver bullion; it is therefore of importance to maintain our silver currency as much as possible in harmony with the currency in which silver is the standard wholly or partly. This condition is met by coining silver ·900 fine, and by coining the half-crown of 15 grams standard silver, as then 5 crowns will contain the same amount of fine silver as 6 five franc pieces. The shilling containing six grams of silver, the franc if of the same fineness will contain five grams of silver. The silver rupee of India and the silver dollar admit of easy adjustments.

12. *Economies of Decimal Coinage.*

Several units of weight are required, and when the Roman notation was in use the advantages of connecting these units by the factor ten were not clear. It was accordingly never done in England. In troy weight four units are recognized, the grain, the pennyweight, the ounce, and the pound; 24 grains make one pennyweight, 20 pennyweights one ounce, 12 ounces one pound. The money units are based on these weights; 240 pennyweights of silver are a pound, and were so called, *libra*, the origin of our 1*l.* The pound sterling and the penny fell in evil days to a third of their primary weight; still 12 pence became a shilling, 20 shillings = 240 pence, = a 1*l.* Then the penny was halved and quartered, so there are four money units in use connected by the factors, 20, 12, and 4; thus 1*l.* = 20 shillings = 240 pence = 960 farthings. The clumsy Roman notation was discarded and was displaced by the beautiful Arabic notation, where each figure in a series is ten more, or a tenth less than the same figure to its right or left; hence all the transcendent achievements of modern arithmetic. Unfortunately our money as well as weight and measure units remained unaltered, and all are now in a state so chaotic as to reflect disgrace on the intelligence of England. To perform a simple sum in compound multiplication or division is beyond the powers of ninety-nine in a hundred educated men, who, on leaving school, forget the tables, which have perplexed, wearied, and wasted so many of their hours.

It is difficult to estimate the economy of time and thought through the whole of life to be realized by the substitution of units decimally related to each other in the place of the units now in use.

France, Spain, Portugal, Holland, Belgium, Switzerland, Italy, Austria, Russia, Greece, Sweden, Turkey, China, Japan, and the United States of America have all decimal moneys of account, and England would probably have already enjoyed this inestimable privilege had it not been for the

difficulties of dealing with the penny. The penny is the rock on which the late project of decimalization split. The phantom of a duodecimal notation in arithmetic deceived nobody. The price of a great number of articles is measured by the penny. Thus the price of 4 lbs. of bread is $6\frac{1}{2}d.$; mutton is $9\frac{1}{2}d.$, beef 10*d.* a pound. In all such instances the price in gold units can be expressed with great accuracy, and a slight variation of price could give rise to no inconvenience, for the prices are perpetually fluctuating; as they are regulated by supply and demand, prices could be more accurately adjusted and expressed in cents than in pence. The price of 4 lbs. of bread is $6\frac{1}{2}d.$, but what is the price of 1 lb.? That is not easily expressed. Certain articles are so constantly associated with the penny as their price that this coin is looked upon almost as an English institution. There is, for instance, the penny toll of some bridges, the penny postage, and the penny newspaper, to say nothing of many other penny articles. The price is thus expressed because the penny coin exists, just as prices in America are expressed in cents.

It is supposed by many that the slightest deviation in the price either above or below the penny will be attended with disturbance or mischief, and it is always assumed that any rise of price or fall of price must inevitably benefit or injure the buyer or the seller in the exact proportion of the fall or rise. But economists know this is erroneous. The toll of Waterloo Bridge was formerly 1*d.*, it is now $\frac{1}{2}d.$, thus the toll is reduced 50 per cent. It was supposed for years by a majority of the shareholders that a reduction of the toll inevitably involved an equivalent loss, and this belief continued until the rival Hungerford Bridge was projected to take people over the Thames for a halfpenny; then the Waterloo Bridge toll was reduced. In the first weeks there was a dead loss, but when I examined the returns the receipts in halfpence exceeded the former receipts in pence although the rival bridge was in full operation. A reduction of price, whether great or small, as in the case of omnibus fares, increases the number of customers, and may either increase or diminish profits. Thus if a toll becomes two cents instead of two farthings, 3 cents or 4 cents instead of four farthings, the slight rise or fall of toll will tend to right itself in the number of passengers. 5 cents will precisely represent the same proportion of a sovereign as three halfpence.

The postage to some towns was formerly sixpence, and it was by many argued that the reduction to a penny would involve an absolute loss to the revenue exactly commensurate with the reduction, and no doubt now if the postage was reduced to 3 cents ($= 0{\cdot}9$ *d.*), that is 10 per cent., some persons would immediately, under the influence of the old fallacy, infer that the revenue would decline to that extent; persons apprehensive of loss would prefer 4 cents ($= 1{\cdot}2$ *d.*), and would by the same fallacy expect an increase of 20 per cent. in the revenue.

Then there is a second difficulty, the penny newspaper, for which battles have also been fought. The price of our newspapers now has a wide range; it runs from 6*d.* to 3*d.*, 2*d.*, 1*d.*, and here it stopped until lately: with the 6*d.* and 3*d.* we have nothing to do as the prices are represented exactly by sixpenny or threepenny coins = 20 or 10 cents; the half of the threepenny = 5 cents, and 4 cents and 3 cents would be in the new decimal coinage at the disposal of the proprietors, who would have no difficulty in adjusting value and price. The *Echo* would probably not object insuperably to the change of two farthings into two *cents*, which would only be an increase of 20 per cent. on the price, and this could easily be expended on the journal.

When once the decimalized gold coin and its token pieces exist down to cents, 10 of which are worth threepence, prices of the smallest articles will be expressed with exactness for all practical purposes.

Its worshippers may be reminded that the metal in the English penny is not now worth a farthing; the penny is only a counter.

The change of the forms of calculation will present the only real difficulty, and if that prove for a time a little perplexing to veterans it will on the other hand be a pleasant path for the schoolboy to travel over; and anything that arouses common people out of their common thoughts is often attended with incalculable advantages, such for instance as the substitution of printed books for written manuscripts, the discovery of America, the revolution of prices by the influx of silver, the reformation, newspapers, the gold findings of the present day in California and Australasia. Nothing is more apt to fall into routine than trade, and our present system is deplorably characterized by its slow progress in comparison with the progress of the other arts of life. A decimalized, a new to some extent, and a scientific money of account will have the most salutary effects if it awaken trade from its routine.

13. *Economies of International Coinage.*

The value of money is, like the value of all other commodities, local: 100 pieces of gold in England may purchase a bill to entitle its owner to receive 101, or 100 pieces of the same coin in Australia. The rate of exchange where the same coins are in use is thus expressed in the simplest manner possible. The recognition of one gold coin as the international medium of exchange gives all the contracting countries the same simple *par*. But it is different where the money units are not the same: there the calculations grow so intricate as to be unintelligible to the public, and to be troublesome even to adepts. Many examples may be cited from the pages of Mr. Tait.

Traders, if trade prices of commodities are quoted in international money and measures, will have no difficulty in perceiving at a glance the state of the markets, and the currents of trade.

Travellers with international money will sustain less loss, and less discomfort than they now encounter abroad.

The relations between man and man will thus be enlarged, and multiplied, in indefinite proportions, when all things are measured, weighed, bought, and sold by the same units.

14. *The 25 franc and the 25 shilling gold unit.**

All the advantages of the decimal notation can be enjoyed under a gold unit of either of these values: but to be scientific, symmetric, international, the 25 franc coin and the sovereign must consist of exactly 8 grams of gold of the same fineness, coined under the same conditions of seignorage. Then the after passage from an 8 gram unit to the use of a 10 gram unit will be easy, and will end in a complete identification of decimal money units with metric weights of gold, as everlasting as the basis of the metric system. The inconvenience of the change though real will be transitory, and the benefit to mankind will be perpetual. By a slight sacrifice the present generation will earn the gratitude of posterity, while it will be more than repaid for its pains in the course of two or three years of its own existence.

In the metric measures, weights, and money, the trade of the world will enjoy perfect instruments, facilitating the exchange of commodities as much as the steam engine accelerates their carriage.

[15. *Basis of International Coinage.*

1. Coined Decagrams of gold of the fineness expressed by ·900 to be the unit measure of value, and the base of an international money of account. Tolerance of fineness ·002; of weight ·002.

* "Taking it altogether, the *shilling* is much more frequently and numerously represented in other coinages than the *franc*." Bullion and Foreign Exchanges. By Ernest Seyd, page 690, where he cites several examples.

2. The decagram, and any convenient sub-multiples of it, to be coined at the mints of each country of the convention.

3. The coinage to be self-sustaining, and the mintage to suffice to pay a fixed charge to defray the cost of coinage, and to maintain a coinage fund to replace the coins that have fallen below the standard weight ·007 by legitimate wear.

4. The charge for this fund to be represented by $\frac{1}{55}$ of the gold coined.

5. 1 kilogram of gold to be coined into 100 decagram coins called Victorias in England, and to be written ₰ 100.

6. *Fifty-five* kilograms of gold to be coined into ₰ 5500, at a cost of ₰ 1 100.

7. This it may be inferred from English experience will cover the whole cost of the gold coinage.

8. The kilogram to be also coined into 125 sovereigns in England and into 25-franc pieces, each of the weight of 8 grams, and containing 7·200 grams of fine gold.

9. The French mint under the present system having no provision for replacing the lost gold in light sovereigns, would coin out of a kilogram 124 twenty-five franc pieces each weighing $\frac{1000}{124} = 8{\cdot}064516$ grams. By coining 125, each of $\frac{1000}{125} = 8$ grams, she gets a part of the coinage fund.

10. Five gram (half-Victorias) and two gram (crowns) gold-pieces to be also coined; the other pieces to be in silver and bronze.

11. The money of account to be in decagrams or grams and centigrams of gold. The gram of gold lies midway in value between the *franc* of France and the *dollar* of the United States, which are the extreme first units of the extant silver currencies (see p. 281), and might suit France, Sweden, Holland, Austria, Spain, Prussia, and Russia as the chief unit of accounts, which would be kept by them, as now, in two columns. The gram coin of account to be named by convention. GUILDER is an open name, and may be appropriated, or as the *Solidus* or *Sol* of Charlemagne of 12 *deniers*, containing only one-seventh part more silver than a silver coin of 15½ grams, is no longer in use,* the convenient name SOL may be adopted as the name of the gold gram money of account. 98327·52 *sols* could be read 98327 *sols* 52 *cents* on the continent. We should write the

₰	s.	c.
same sum 9832	7	52 to be read 9832 *Victorias* 7 *sols* 52 *cents*.

Note.—Mr. Graham, Master of the Mint, and Mr. J. T. Smith, late Master of the Calcutta Mint, estimate when 10,000,000*l.* are coined annually, the cost of making a sovereign at £·0021 (a halfpenny), and the loss by abrasion in 18 years, when the sovereign in circulation falls below the legal standard at £·0062787 (three halfpence). Now at 3 per cent. interest, the discounted value of this sum payable at the end of 18 years is $\left(\frac{1}{1{\cdot}03}\right)^{18} \times {\cdot}0062787 = £{\cdot}0036881$. Two half sovereigns cost a penny for coinage, and of their weight lose in ten years ·00830671, of which the present value is $\left(\frac{1}{1{\cdot}03}\right)^{10} \times {\cdot}0083067 = £{\cdot}006181$. If the sovereigns coined in value are to the half sovereigns in the proportion of 38 to 12, the cost of making and maintaining these coins will be about £·007 per 1*l.* The cost of coining at the present rate of 5,000,000*l.* a year is £·003; and that would make the charge of making and maintaining the coin about £·008 or 2*d.* per 1*l.*

The mintage charge for coinage should be sufficiently high to pay the cost of mintage at all times, and to replace the gold lost by wear, The coinage of a sovereign, we see, now costs 3 farthings at the mint; the bank charge is 1½ farthings, and about 6 farthings will replace the gold lost by wear in circulation during 18 years, when it falls below the legal weight. The coinage of two half sovereigns costs about 6 farthings, and about 8 farthings replace their gold lost in ten years, when they fall below the legal weight. The Master of the Mint, and Mr. J. T. Smith, show that £·017, exclusive of bank charge, or 4*d.* per 1*l.* will provide for the first coinage and permanent maintenance of our mixed circulation of sovereigns and half sovereigns. For finer coins as works of art, the cost will be greater.—*See Report relating to gold currency by T. Graham, Master of the Mint, and J. T. Smith, late Master of the Calcutta Mint.* Paper presented to House of Commons, 28th June 1869. [*See* subsequent Introduction to Coinage Tables.]

* At one time it was as a money of account the English shilling. (*See* Doomsday.)

Introduction to Gold-Coin Circulation Tables.

The sovereign and half-sovereign in circulation in England cease to be a legal tender after they fall below a certain weight, and by a royal proclamation of 1842 they are directed, when light, to be cut and withdrawn.

For various purposes it becomes important to determine in what way the wear operates in reducing two coins of different weights, circulating under these conditions.

The state of the coinage can then be appreciated.

And the cost of issuing, and of replacing the lost gold can be estimated.

All the existing sovereigns have been coined in the last 53 years, and the earliest sovereigns and half-sovereigns bear the Mint impress of 1817; and we have thus under hand the experience for a series of years of a circulation of two gold coins.

In my inquiries I have obtained much information from the various sources referred to in this paper, from Sir John Lubbock, and others. But looking to the great interest of the inquiry into the working of the English gold currency, and its international bearings, I ventured to write to Mr. Crawford, the Governor of the Bank of England, who has been good enough through Mr. George Forbes, the Chief Cashier, to place at my disposal the returns on which the following Tables are based.

From the facts in Table X., p. 277, it is seen that on a large mass of light gold coin withdrawn from circulation the loss of weight from standard weight was 1·062 per cent.; so £1 had lost rather more than $2\frac{1}{2}d.$ = £·01062 of its value. Up to the loss of £·00628 ($1\frac{1}{2}d.$) the sovereign is current, and after that depreciation the coin is no longer a legal tender; but these coins after that point had been attained lost £·00434 more before they were withdrawn. Therefore, if the rate of wear was uniform, it follows that for 40 per cent. of the time they were in circulation the sovereigns were below the legal weight.

The sovereigns and half-sovereigns are separately weighed at the Bank but they are mixed up in this Table; and as they wear away at very different rates, it is right to bear in mind that 86·75 per cent. in value of £150,000,000* weighed in the Bank scales in the 10 years 1859–68 was in *sovereigns*.

It will be noticed that the lightness of the coin withdrawn increased during each quinquennium, and that in the last the depreciation was 1·16 per cent.

If we know the number of years a series of light coins has been in circulation and the loss of weight, the annual rate of loss can be determined.

The facts in Table IX. supply data, not so numerous as might be desired, but sufficient to enable us to get approximate results, and to determine the law of waste of gold coin in circulation.

In the year 1869 of 3913·5 sovereigns weighing 1000 ozs., and withdrawn at the Bank, 5 bore the inscription 1817. Now if these sovereigns had been in circulation 52 years, and if we write 52 against each sovereign coined in the first year, and 51 against the one cut sovereign coined in 1818, and 49 against each of the 6 coined in 1820, and 48 years against each of the 30 cut in 1821, and so on to the end: then the sum of these numbers will give the number of years the sovereigns have been in circulation: dividing by that number and subtracting ·5 the average number of years is obtained. The process is abridged by multiplying the years by the coins.

---

* Bank Returns.

There is some uncertainty about the precise date of coinage, and of withdrawal ; but adjusting this as closely as we can it is found that these sovereigns had circulated 26·22 years ; and that during the time they had lost ·01052 of their original weight taken at 1·00000. But $\frac{\cdot 01052}{26\cdot 22} = \cdot 0004$ = annual rate of waste.* By another tabular arrangement this and a great many more results of the highest interest are deducible from the same facts. But some preliminary adjustments are required, and before this past experience can be applied to the future it is necessary to turn these numbers into such others as would have been probably obtained, had the numbers coined in each year been uniform: these corrected numbers are given in a condensed form in Table VII. The numbers were thus raised from 3913½ to 4280 ; but this number is arbitrary and may be raised to 10,000 if all the other numbers are raised proportionally. Further, as the numbers cut each year are irregular accidentally, they are distributed by interpolation over 50 years, as shown in the second column headed d_x of Table I. From this column, derived from and exhibiting the facts from actual observation, all the other columns were deduced. The column headed l_x is obtained by adding up the numbers in the column d_x : of which it is the sum. Thus 9995 (that is l_4) is the sum of the numbers in column d_x up to d_4.

Of the sovereigns from the Mint a certain number after they have been issued by the Bank are melted, others are exported and never return, and a few are lost, of none of these we here take account ; but of the 10,000 that we can follow to their place of doom in the Bank, column l_x shows the surviving numbers year by year of age.

It is convenient for analysis to call the time a coin has been in circulation (x) its age, and the mean time it will remain after that age in circulation, its after lifetime E_x ; its withdrawal from circulation may be called figuratively for shortness, its death.

And it may be assumed that the sovereigns d_x withdrawn in any year of their age x and under $x+1$ are withdrawn at equal intervals through that year. Then as 18 of 9995 attaining the age 4 are cut in the year following, leaving 9977 in circulation at the end of the 5 years ; it follows that $9995 - \frac{18}{2} = 9986$: this is the number against P_4 in the column headed P_x. The equation of $P_x = l_x - \frac{d_x}{2}$ shows how the column P_x has been constructed : it is out of 274,809 sovereigns in circulation the numbers in the $(x+1)$ year of existence.

The column Q_x is formed by the successive addition from the bottom of the numbers in col. P_x. It represents the number of sovereigns sustained in circulation, where none are melted or lost by an annual coinage of 10,000.

The column Y_x is derived from the column Q_x, by the continual addition from the bottom of all the values $\frac{Q_x + Q_{x+1}}{2}$. At the head of the Table the Greek sigma (Σ) indicates the *sum of the series* up to the age x.

---

* Professor Jevons makes the annual rate of waste only ·00035, by estimating it from the weight of *circulating sovereigns*, thus not allowing for the waste in light sovereigns withdrawn by the bank. By using this factor he makes the mean time in which average sovereigns remain of legal weight 18 years = $\frac{\cdot 00628}{\cdot 00035} = 18$. They really wear below the legal standard in $\frac{\cdot 00628}{\cdot 0004} = 15\cdot 7$ years, as Professor Jevons would have found had no light sovereigns been withdrawn. It is the only oversight I have discovered in his able and original paper. The waste by his Table is ·0004 in the first four years.

The relation of the figures in the several columns to each other are shown by the subsequent equations; where $x = \omega$ is the last age in the Table.

I. $l_x = d_x + d_{x+1} + d_{x+2} \ldots\ldots d_{x+n-1} \ldots\ldots d_\omega$

$l_x - l_{x+n} = d_x + d_{x+1} \ldots\ldots d_{x+n-1}$

$P_x = l_x - \frac{1}{2}d_x = l_{x+1} + \frac{1}{2}d_x$

$Q_x = P_x + P_{x+1} + P_{x+2} \ldots\ldots P_\omega$

$= \frac{1}{2}l_x + l_{x+1} + l_{x+2} \ldots\ldots l_\omega$

$= \frac{1}{2}d_x + 1\frac{1}{2}d_{x+1} + 2\frac{1}{2}d_{x+2} + 3\frac{1}{2}d_{x+3} \ldots\ldots$

$(n+\frac{1}{2})d_{x+n} \ldots\ldots\ldots$

Note.—This column gives the years the cut sovereigns had circulated after the age x, and when $x = o$ it shows the average number of years the sovereigns remain in circulation:

thus $E_o = \frac{Q_o}{l_o} = \frac{274,809}{10,000} = 27{\cdot}4809$ years is the average duration of a sovereign's life under the present law.

$Y_x = \frac{1}{2}Q_x + Q_{x+1} + Q_{x+2} \ldots\ldots Q_\omega$

$= \frac{1}{2}P_x + 1\frac{1}{2}P_{x+1} + 2\frac{1}{2}P_{x+2} + 3\frac{1}{2}P_{x+3} \ldots\ldots$

$E'_o = \frac{Y_o}{Q_o} = \frac{4,248,961}{274,809} = 15{\cdot}46$ years = the mean age of circulating sovereigns.

Note.—By an entirely different method Professor Jevons makes the mean age of sovereigns 15·35 years. *Journal Statistical Society*, 1868, p. 458.

A somewhat similar table was constructed for half-sovereigns; and the two fundamental half-sovereign columns from which all the others can be constructed are given in Table II. By adding up the column l_x another column L_x is obtained; and by adding up the new column L_x, substitutes for columns Q_x and Y_x are readily obtained: and $E_x = \frac{L_x - \frac{1}{2}l_x}{l_x}$ = mean time half-sovereigns remain in circulation after age x; so also $E'_x = \frac{\frac{1}{4}l_x + S_{x+1}}{L_x - \frac{1}{2}l_x} = \frac{Y_x}{Q_x}$ = mean number of years they have circulated, and will circulate over age x.

$E_o = 19{\cdot}60$ years = mean time a half-sovereign remains in circulation:

$E'_o = 11{\cdot}67$ years = mean age of *half-sovereigns* in circulation.

Some uses of the Tables I. *and* II.

The Tables show at a glance how long it is *probable* a sovereign, if not prematurely melted or lost, will remain in circulation after any age x: thus put $\frac{l_x}{2} = l_{x+n}$; and n being found, is the *probable* time a sovereign will continue to circulate: at age 10 it is 18 years for $\frac{l_{10}}{2} = \frac{9648}{2} = l_{10+18} = .4924$; at its date of issue the probable lifetime of a sovereign is between 27 and 28 years; of a half-sovereign 18 and 19 years.

$\frac{Q_x}{l_x}$ = the mean time a coin will remain in circulation after age x;

$\frac{Q_o}{l_o} = 27{\cdot}50$ years for sovereigns; and 19·60 for half-sovereigns.

$\frac{Y_x}{Q_x}$ = (1) mean time the sovereigns of the age x and upwards have remained in circulation over age x: (2) the mean time they will continue in circulation.

$\frac{Y_o}{Q_o}$ = mean age of sovereign circulating (15·46 years); of half-sovereigns 11·67 years.

Note.—These ages of the living are deduced from the ages of the expiring coins.

$\frac{d_{x+n}}{l_x}$ = probability that a sovereign will be cut in the year following any year of age $x + n$.

Now putting i the year's simple interest of £1 and $v = \frac{1}{1+i}$ the present value of a £1 to be received at the *beginning of the year* in which a sovereign is cut is $\frac{v^o d_o}{l_o}$, and $\frac{v^1 d_1}{l_o}$, and $\frac{v^2 d_2}{l_o}$ ..... $\frac{v^n d_n}{l_o}$ to the last year of life.

All these values from the date of coinage are shown in Table II. as well as their sums. Hence it appears that at the date of coinage the value of £1 to be paid when every sovereign of the 10,000 is cut is £4626; consequently the value of £1 to be paid on each sovereign is £·4626; while the value of £1 to be paid at the expiration of each half-sovereign is £·5782. See Tables II and III.

Loss of weight of coins by wear.

The Table VI. is condensed from others. An average sovereign of weight 1·0000 is taken from the facts to decrease ·0004 in a year; ·0008 in two years; ·0010 in 2½ years; ·0012 in 3 years, and so on. The weight of the sovereign then falls successively in the same times from 1·0000 to ·9996; ·9992; 9990, &c. But the sovereigns do not all wear equally; the amount of attrition to which they are exposed varies greatly; as will be evident on examining a good many sovereigns of the same date, and loss of gold on the light sovereigns culled increases with age, but not according to the preceding law: these losses of weight are shown in the second column from a Bank return of the weights of 1000 light sovereigns of the several ages. See Table VIII. The third column (Table VI.) shows the ascertained loss of weight on a certain number of circulating sovereigns. The same facts are shown for half-sovereigns in columns 4, 5, 6 of Table VI.

Table III. Let the loss of weight per £1·0000 on withdrawn sovereigns of each age x be w_x; and $w_x d_x$ will be the loss in value of weight of d_x sovereigns cut at age x and under age $x + 1$; and $v^x w_x d_x$ will be the present value at age 0 of that loss. The sum of the values obtained by making x vary in this equation from 0 to 52, is the present value of the loss on the 10,000 sovereigns grown light: taken up to the date of cutting it is £46·27. For each sovereign the present value of the lost gold is u = £·004627; for each half-sovereign it is u' = £·0101645.

Now let each of the 10,000 sovereigns be replaced by another at the date the first is cut; then we know the mean value of the lost gold on what may be called sovereigns of the third generation is at their date of issue u; but they are issued when the sovereigns of the second generation are cut: consequently the value of this lost gold of the third generation at the date when the sovereigns of the second generation are issued is πu; and its value when the sovereigns of the first generation

are issued is $\pi\pi u = \pi^2 u$. In like manner it may be shown that the mean value of the lost gold of the fourth generation is when the first generation is issued $\pi^3 u$. And to get the value in perpetuity we have merely to sum the series $u + \pi u + \pi^2 u + \pi^3 u$ . . . . . .

$$\text{Sum of series} = u(1 + \pi + \pi^2 + \pi^3 \ldots\ldots \pi^\infty)$$

$$= \frac{u}{1-\pi}$$

The same formula taking the proper figures gives the present value of all the gold required to keep up an endless succession of half-sovereigns.

Let c be the whole cost of making a coin, then $u + c$ will be the cost of making and also the value in gold which at interest will supply the average waste of gold on that coin. Thus, if the cost of making a sovereign is £·0021, and £·0046 the present value of the gold to replace the ascertained waste of metal at its withdrawal, each successive coined sovereign costs £·0067; of which the value of a perpetual recurring succession is $\frac{1}{\cdot 5374} \times \cdot 0067 = £\cdot 01246$.

For 2 half-sovereigns, if the coinage of each costs as much as the coinage of a sovereign, the formula—

$$\frac{c+u}{1-\pi} = \frac{2 \times \cdot 0021 + \cdot 0102}{1 - \cdot 5782} = \frac{\cdot 0144}{\cdot 4218} = \cdot 03414.$$

Thus, if the sovereign and half-sovereign remain as long in circulation as they have hitherto done the sum of £12,460 invested at 3 per cent. interest would form a coinage fund sufficient to float and sustain in perpetuity £1,000,000 in sovereigns, while £34,140 would be required to float and sustain £1,000,000 in half-sovereigns.

The longer the coins remain in circulation the more gold is required to supply the waste; that is an increase of cost; but the deferred payment has the effect of diminishing the present value; as is evident in the equation $\frac{1 - n\,w}{(1+i)^n}$, where w is the annual waste by wear out of £1; n is the number of years wear; and $\frac{1}{1+i}$ = the present value of £1 payable at the end of a year, when the interest of £1 in a year is i.

The following is one of the many practical applications of the Tables:

Lifetime of gold coins.

Gold is the most indestructible of all coin. The pure metal is preferred in the East; and in England the first gold coins were of great fineness. But experiment has shown that the alloys of silver and copper in the existing gold coin of Europe harden them, and protect them from attrition, either ordinary or artificial. Subject to every usage the gold in sovereigns wears away at so slow a rate, that its weight is only wasted by wear during a circulation of 2500 years; and as some of the gold of a *darec* of Darius, a *stater* of Alexander, an *aureus* of Augustus, a *rose noble* of Edward III., an *angel* of Elizabeth, a *guinea* of George III., may exist in *sovereigns* of Victoria, so the gold in sovereigns after receiving hundreds of impresses may survive thousands of years. Other substances undergo changes by chemical combinations; but gold has no affinities for the ordinary substances of the earth; and maintains its virgin purity through endless ages.

Sovereigns perish by wear, inasmuch as coins only discharge their functions legally, so long as they retain a fixed weight a little below the

standard;* and as the wear by use varies infinitely, while some remain almost intact for an indefinite time, others fall below the standard in a few years.

In England new coins remain safe in the Bank some time; but they are no sooner issued than they are exposed to several risks, which vary with circumstances. Great numbers in the first years, when they are of full weight, have rapacious enemies; they die what may be called violent deaths; and are melted, as they may now be lawfully, either in this country or abroad, as common bullion; others are exported while they are of current weight, and never return. Some are hoarded, some lost. Deducting these, the rest circulate until they are worn out; until the effigy grows dull, until the sharp lines are blunted, until the weight is sensibly depreciated. They might linger on, wasted by age, did they not meet with a happy dispatch. Every sovereign that comes to the Bank of England is weighed in a machine, which rejects all that have lost gold worth £·0063 or $1\frac{1}{2}d.$; they are said technically to be cut, and are withdrawn from circulation. The half sovereign is legally current until $1d.$ worth of its gold is wasted. Thus a *sovereign* is current until it has lost gold worth £·0063; two *half sovereigns* float until they have lost £·0083 of their gold.

By the Tables it is seen that sovereigns wear away at the average annual rate of £·0004; consequently a coinage of sovereigns falls below current weight in 15·7 years. Half sovereigns wear away at the more rapid rate of £·0010, and a coinage falls below the least current weight in 8·3 years.† The half sovereign wears away $2\frac{1}{2}$ times as fast as a sovereign.

In practice sovereigns circulate 27·5 years, half sovereigns 19·6 years before they are cut at the Bank; during 11·8 years the sovereigns, during 11·3 years half sovereigns circulate below the legal weight.

That a sovereign is cut depends on two chances; it must fall below the fixed current weight, and it must be paid into the Bank of England. Hence its existence is protracted.

Let us follow 10,000 sovereigns through the circulation until they return to the bank shears. At birth they differ slightly in weight; and if the standard weight is represented by 1·0000, the heaviest sovereign issued may by tolerance be 1·0021, the lightest ·9979; so difficult is it to coin equal weights of metal.‡ A sovereign may fall to ·9937, and still remain current; and it is found *by experience* that from some cause or other certain numbers fall below this weight in a few years, and are on that account cut; taking up the Tables (I. and VI.) it is found that at the end of 15 years 8778 remain in circulation, having an average weight of ·9943; some of the 8778 have been hoarded, others have been much used and worn perhaps unfairly: upon mustering them the heaviest might weigh 1·0021, and be therefore ·0078 above the mean weight of his comtemporaries, and the lightest may be as much below the average or ·9865. Mustering them in companies arranged by weight, there would be a series

---

* Weight of sovereign in grams:—7·988 standard.
7·938 least current.
·050 loss.

Weight of two half sovereigns:—7·988 standard.
7·922 current weight.
·066 loss.

† $\frac{·0063}{·0004} = 15·7$ years; and $\frac{·0083}{·0010} = 8·3$ years.

‡ The tolerance of weight which was $\frac{1}{480} = ·00208$ will be reduced to ·002 by the new coinage Bill.

ranging from the one extreme of 1·0021 through the centre ·9943 down to ·9865. The numbers at the two extremes would be few; they may be one or two; the numbers on each side of the centre may be equal; they would increase rapidly as they approached the centre, where the largest group would cluster. The range of weight from the sovereign of lowest weight to the *mean* would be ·0078; from the mean to the highest weight also ·0078; the extreme range being ·0156. Evidently, as the mean weight of the whole is only a shade above the current weight, nearly half of the 8778 sovereigns still circulating must be below the current weight; and we can only be surprised to find that no more than 222 are cut in the year following. Every year the mean weight of the mass grows lighter, and the range of weight greater; at the age of 30 the numbers in circulation fall to 4236, having an average weight of ·9890; which reasoning as before, implies that as there may be a sovereign of that age weighing 1·0021, there may be its counterpart weighing only ·9759.* The great mass of the coins falls below the legal current weight in forty years, and in fifty years only a few relics survive in the circulation.

Reasoning upon this basis of the 8556 sovereigns attaining the age of 16, when the average weight has just fallen below the legal current weight, nearly 4278 are still above that weight; and indeed the coins range up to the full standard weight.*

Coins in circulation.

It is evident that if sovereigns continue in circulation 27·5 years, a constant annual coinage of 1,000,000 will sustain 27,500,000 in existence.

The mean normal age of sovereigns under this law is shown to be 15·5 years; the mean age of the sovereigns having a definite relation to the ages at which they expire.

If the amount of the coinage, and the lifetime of sovereigns remain invariable, the numbers withdrawn here annually must in the end equal the numbers coined annually, unless they are melted, lost, or sent for ever out of the Kingdom.

Now the number of sovereigns coined annually in 1817–1868 is known; it is £3,331,000, or in the aggregate £173,216,000. The number of half-sovereigns coined in the same years was 41,574,000; worth £20,787,000. The annual coinage then issued was £3,730,750 yearly. The total amount of light sovereigns and half-sovereigns cut at the Bank of England and its branches is about £30,000,000, so that not more than £600,000 expire annually in the arms of the Bank from which they issued. This implies a perpetual, a rapid increase of gold coin in England, if none expire elsewhere, and in other ways than wear. In effect £194,003,000 have been coined; and after deducting £30,000,000 withdrawn at the Bank of England £164,003,000 is left; and if large quantities of light coins are disposed of in other quarters a large surplus still remains unaccounted for.

Again from the Tables I, II, and IX, the number surviving in 1869 out of the respective numbers coined in each year since 1817 can be estimated, and is found to be £103,531,175 in sovereigns; £11,208,472 in half-sovereigns; or £114,739,647 in the aggregate.

That is the number that would be *in existence* in the United Kingdom in the year 1869, had none been in the interval lost, exported, or melted down.

---

* The average weight in grains is indeed 122·500 grains: but half the numbers are at and above that weight running up to 123·474 grains, while by way of compensation the residual half descends as low as 121·526 grains; the range being 1·948 grains.

Now, Professor Jevons by an independent method estimates in 1868 the existing amount of gold in half sovereigns at £12,000,000, in sovereigns at £68,000,000; in both coins at £80,000,000. His first estimate makes the number of *sovereigns* £78,500,000; and the last is what he conceives the corrected number. Mr. Miller, of the Bank of England, held that there could not be less than £80,000,000 of gold in the country, Mr. Jevons contends that there cannot be more. Upon the whole this appears to be a well worked out estimate. It includes £6,100,000 of gold in the Bank; of which £3,400,000 had not been issued, besides £100,000 of Australian coin. The gold coin held by the Bank (London and branches) at the beginning of 1869 was about £6,200,000, at the end of the year about £11,200,000.

The coinage of £194,000,000 issued in the 52 years (1817–68) was widely distributed over the world; and here or elsewhere, at the calculated rate of decrease, must have been reduced to £115,000,000 in round numbers; so £79,000,000 would be withdrawn at the normal rate; but the Bank of England accounts for £30,000,000. How have the remaining £49,000,000 at home or abroad been withdrawn? At the normal ages certain numbers have been lost, others, many of them of full weight probably have been withdrawn without the knowledge of the Bank, and in the East especially great numbers instead of having been withdrawn have been hoarded; now sovereigns hoarded for years or converted into ornaments are as much lost to the circulation as sovereigns withdrawn by the Bank.

Again, of the £115,000,000 which should be in circulation, there are by estimate £80,000,000 in the Bank or in circulation in the United Kingdom. Where are the other £35,000,000? Flown to a large extent, and circulating in other countries, replies Mr. George Forbes, the Chief Cashier of the Bank of England, and a keen observer of coin movements. Vanished in the melting pot, say others. The truth probably lies between the two hypotheses; coin is exported; coin is in the first years after its issue melted largely; in what proportions remains to be determined.

Mr. Forbes shows that in the 18 years 1852–69 no less than £70,555,000 of British gold was exported; £30,275,000 of it to India, China, Egypt, and the Mediterranean. As it goes and comes the same coin may figure more than once in the returns; he is unable to supply the amount of British coin imported.

TABLE I.

Sovereign Circulation Table.

Showing (1) how 10,000 Sovereigns (l_x) coined remain in Circulation, or are withdrawn (d_x) at the Bank of England; (2) how many Sovereigns (Q_x) are sustained in Circulation by an annual coinage of 10,000 (P_x and Q_x); and (3) the Years (Y_x) those Sovereigns have remained or will remain in Circulation over any age (x).

Age (the years the coins remain in circulation).	Expiring in each year of age.	Sovereigns coined and surviving at each age.	Sovereigns in circulation in each year of age.	(1) The sum of the Sovereigns in circulation of each age x and upwards; also (2) the sum of the years which l_x Sovereigns will live.	(1) The sum of the years which the Sovereigns Q_x of the age (x) and upwards will remain in circulation; also (2) the sum of the years they have circulated over age x.
		$\Sigma\, d_x$	$l_x - \frac{1}{2}d_x$	$\Sigma\, P_x$	$\Sigma\left(\frac{Q_x+Q_{x+1}}{2}\right)$

49	18	34	25	33	24
50	16	16	8	8	4

Note.—This Table is constructed from the data in Tables 3 and 9, supplied by the Bank of England. It deals only with the Sovereigns that are issued by, and returned to, the Bank. It represents the normal condition of the English Coinage under the law as at present administered, by which the Bank almost alone cuts light Sovereigns—that is, Sovereigns weighing less than 122·5 grains Troy, the standard weight being 123·274 grains; the allowed loss of weight of gold 0·774 grain, worth about $1\frac{1}{2}d.$ = £·0063.

TABLE II.

Sovereign and Half Sovereign Valuation Tables.

Sums	279,809	201,021	10,000	10,000	4695·16	5869·40

Note.—The Table may be read thus:—Of 10,000 Sovereigns issued and cut at the Bank, nearly one half, or 4,923, remain in circulation 28 years; whereas, out of 10,000 Half Sovereigns, only 1,342 attained that age; in the year following 348 of the 4,923 remaining Sovereigns, and 377 of the remaining Half Sovereigns are cut. The Discounted Value at the date of issue of the 348 Cut Sovereigns was $152{\cdot}10 = \frac{1}{(1{\cdot}03)^{28}} \times 348$, on the assumption that the rate of Interest is 3 per cent., and that they are cut at the beginning of the 29th year, and so in like manner the value of the Cut Half Sovereigns was 164·78. For other ages the reading is similar; the sum of these values is the Discounted value at Issue of the 10,000 Cut Coins.

TABLE III.

VALUATION TABLES in Summary, showing discounted values at issue, of Gold lost by the time Coins are cut.

Age, x.	At Date of Issue.			
	Discounted Values of £1 payable when the several coins are cut.		Discounted Values in £1, of lost gold payable when coins are cut.	
	$v^x d_x$		$v^x d_x w_x$	
	10000 Sovereigns.	10000 Double Half Sovereigns.	10000 Sovereigns.	20000 Half Sovereigns.
0— 5	20	64	·14	·561
5—10	265	889	1·96	9·001
10—15	606	1448	4·48	19·170
15—20	739	1403	6·04	24·030
20—25	809	1036	7·24	22·580
25—30	797	849	8·07	22·490
30—35	643	51	7·51	1·510
35—40	521	44	6·89	1·371
40—45	268	38	4·07	1·214
45—50	24	32	·57	1·243
50—53	3	15		
Sums	4695	5869	46·97	103·170
Corrected Sums	4626	5782	46·27	101·645
Present Values at Issues on each.	$\pi = ·4626$	$\pi' = ·5782$	·004627	·0101645

The Table may be read thus :—

The Value at date of issue of £1 payable at the extinction of a Sovereign is ·4626*l.* (say π); of 2 Half-Sovereigns ·5782 (say π'); at the same date the value of the lost gold is for the Sovereign ·004627; for the 2 Half-Sovereigns ·0101645.

The present value of the lost gold on all the successive coinages of Sovereigns is $\frac{1}{1-\pi} \times ·004627 = \frac{·004627}{·5374} = ·0086$.

The present value of lost gold on 2 Half-Sovereigns, or the value of the perpetuity is $\frac{1}{1-\pi'} \times ·0101645 = \frac{·0101645}{·4218} = ·02410$.

Corrected numbers for the lower lines are obtained by adding up their respective columns, and dividing the sums by 1·015. This has the effect of giving the values on the Sovereigns and Half-Sovereigns at the time they are cut, assumed to be at equal intervals through the year, or on an average in the middle of the year.

Note.—The loss of gold on a cut sovereign is, by an unpublished Table, on an average ·0107; the weight being reduced from the standard 1·0000 to ·9893. The loss of gold on two cut Half-Sovereigns is in like manner on an average ·0191; the standard weight of the two being the same as the standard weight of the Sovereign represented by 1·0000 falls to ·9809. The sovereigns cease to be legal tender, and are liable to be cut when they have lost ·00628 of their weight; that is when the weight has fallen from 1·0000 to ·99372; half-sovereigns when the weight has fallen ·00831 from 1·0000 to ·99169.

TABLE IV.

Sovereigns.

Duration of Circulation (deduced from Table I).

Age.	Mean after-Existence of Sovereigns of age x.	Mean after-Existence of Sovereigns of age x and upwards.	Mean age of Sovereigns in circulation of age x and upwards.	Mean age when cut at the Bank	
				of Sovereigns in circulation of age x.	of Sovereigns in circulation of age x and upwards.
x	$E_x = \frac{Q_x}{l_x}$	$E'_x = \frac{Y_x}{Q_x}$	$x + E'_x$	$x + E_x$	$x + 2\ E'_x$
(1)	(2)	(3)	(4)	(5)	(6)
0	27·50	15·46	15·46	27·50	30·92
5	22·50	13·34	18·34	27·50	31·68
10	18·25	11·38	21·38	28·25	32·76
15	16·78	9·58	24·58	29·78	34·16
20	11·74	7·88	27·88	31·74	35·76
25	9·11	6·31	31·31	34·11	37·62
30	6·88	4·80	34·80	36·88	39·60

The Table may be read thus :—

Col. (2) Sovereigns issued at the Mint and returning light to the Bank remain in circulation 27·50 years.

„ (3) Those that have been already in circulation 10 *years or more* will continue in circulation for 11·38 years longer.

„ (4) The mean age of all the sovereigns in circulation is 15·46 years.

„ (5) The mean age of sovereigns now of the age of 10 when cut will be 28·25; and the mean age, when cut, of all sovereigns now existing will be 30·92 years.

Note.—These numbers are from the Table I. corrected for inequalities in the annual coinage. The mean age of the sovereigns actually cut was 26·22 years, as the annual coinage had gone on increasing.

TABLE V.

Half-Sovereigns.

Duration of Circulation.

Age.	Mean after-Existence of Half-Sovereigns of age x.	Mean after-Existence of Half-Sovereigns of age x and upwards.	Mean age of Half-Sovereigns in circulation of age x and upwards.	Mean Age when cut at the Bank	
				of Half-Sovereigns in circulation of age x.	of Half-Sovereigns in circulation of age x and upwards.
x	$E_x = \frac{L_x - \frac{1}{2} l_x}{l_x}$	$E'_x = \frac{\frac{1}{4} l_x + S_{x+1}}{L_x - \frac{1}{2} l_x}$	$x + E'_x$	$x + E_x$	$x + 2\,E'_x$
(1)	(2)	(3)	(4)	(5)	(6)
0	19·60	11·67	11·67	19·60	23·34
5	14·71	9·81	14·81	19·71	24·62

25	5·77	5·89	30·89	30·77	36·78

The Half-Sovereign remains on an average in circulation 19·60 years (col. 2); the mean age of the Half-Sovereign in circulation is 11·67 years. See reading of Sovereign Table.

Note.—The L_x stands for the sum of the Half-Sovereign column l_x (Table 2) up to the age x inclusive; so $L_x - \frac{1}{2} l_x = Q_x$; and again S_{x+1} = sum of said column L_x up to L_{x+1}; and $\frac{1}{4} l_x + S_{x+1} = Y_x$.

TABLE VI.

Loss of Weight on average Sovereigns and on two average Half-Sovereigns, weighing 1·0000 at date of issue. (Weights lost correspond to the middle year of each Period.)

Age in Years.	Sovereigns.			Half-Sovereigns.		
	Loss, if Annual Decrement is constantly ·0004.	Loss on Coin cut at the Bank.	Loss on circulating Coin.	Loss, if Annual Decrement is constantly ·0010.	Loss on Coin cut at the Bank.	Loss on circulating Coin.

15–20	·0070	·0082	·0066	·0175	·0172	·0182
20–25	·0090	·0090	·0084	·0225	·0219	·0232
25–30	·0110	·0101	·0101	·0275	·0265	·0282
30–35	·0130	·0117	·0119	·0325	·0296	·0332
35–40	·0150	·0132	·0136	·0375	·0312	·0382
40–45	·0170	·0152	·0154	·0425	·0320	·0432
45–50	·0190	·0238	·0171	·0475	·0328	·0482

(1.) 3,935·5 light sovereigns cut at the Bank weighed 1,000 ounces, so the average weight was ·2541 oz., the standard being ·2568; they had lost ·0027 oz. in 26·22 years, that being their mean age; the annual loss on a unit of weight was $\frac{\cdot 0105}{26 \cdot 22} = \cdot 0004$. The mean loss of weight on 1,000 taken out of the same batch was the same, and their mean age was 25 years.

(2.) This is derived from the actual weights of light sovereigns cut at the Bank in 1869; the weights being distinguished for each year of coinage extending from 1868 to 1817. The coins of 1864–8 are taken as 0–5 age, those of 1859–63 as 5 and under 10 years of age.

(4) and (5). The mean loss on 1,000 cut light half-sovereigns was ·002276 oz. on the standard, ·128411 oz.; or ·017724 on a unit of weight; the mean age of the 1,000 coins was 17·175 years; the annual loss on a unit of weight was therefore ·0010. The loss on cut coins of various ages was determined by weighing in 1869 1,000 light half-sovereigns coined in the years 1817–1865.

(3) and (6). These columns are deduced from the experiments of Professor Jevons, who weighed 434 sovereigns and 178 half-sovereigns after careful cleansing. He estimates the loss of weight taken on an average sovereign circulating at 0·0051* of its standard weight, the deficiency on the circulating half-sovereign at ·0110. He gives the weights of the coinages of the several groups of years, and proves that the circulating sovereigns and half-sovereigns grow lighter year by year; the sovereigns coined in 1860–67 having lost weight at the rate of ·00040; and those of 12 and more years existence at a rate which may be set down at ·00035. The reduced loss of weight is naturally produced in the circulating coins by the withdrawal of light ones. The half-sovereigns decreased at first at the rate of ·00128, and afterwards at the rate of about ·0010. From these data the loss of weight of the circulating coin of various ages was deduced.

---

* By our corrected Table, which makes the proportional number of sovereigns of the several ages in circulation different from those few which he happened to weigh, the loss of weight on circulating sovereigns is ·0058; on circulating half-sovereigns of ·0126.—(*See Statistical Journal for December* 1868, pp. 461 *and* 462.)

The mean weight of 3,000 sovereigns in circulation weighed at the bank was ·25581 oz., the standard being ·25682 oz., thus they had lost only ·0039 out of a *unit* of standard weight and were better by about ·0019 than the average. This was the effect of selection, as the owners, avoid as much as possible sending suspiciously light sovereigns to the bank.—(*See International Coinage Report*, p. 94.)

TABLE VII.

CORRECTION to show what the Proportional Numbers cut in 1869 might have probably been if the annual Coinage had been constant.

Years when coined.	Actual Numbers cut at Bank as per return.		Corrected Numbers.	
	Sovereigns.	Half-Sovereigns.	Sovereigns.	Half-Sovereigns.
1864–68	13	9	44	8
1859–63	111	154	109	152
1854–58	490	224	372	207
1849–53	759½	294	522	288
1844–48	717	148	664	191
1839–43	626	152	756	219
1834–38	277	5	683	22
1829–33	415	—	689	—
1824–28	449	10	393	22
1819–23	50	1	41	21
1817–18	6	3	7	2
Total	3,913.5	1,000	4,280	1,132

Note.—In round numbers 171,563,000 sovereigns were coined in the 51 years 1817–67.

The average number of sovereigns coined annually was therefore 3,364,000. From a table showing the numbers in 3913·5 light sovereigns cut in 1869, and coined in those 51 years, and from the numbers coined in each year; the proportional numbers were deduced which would have probably been cut had the annual coinage been constant.

Formula a = mean number of coins stamped annually (3,364,000).

n_x = numbers issued in each year x.

s_x = numbers out of 3913·5 cut at Bank, of sovereigns coined in that year.

s_x' = numbers that would probably have been cut had the same numbers been issued annually.

Formula $\frac{a\ s}{n} = s'_x$ = corrected number.

Through the year 1853 the numbers issued (n_{53}) were 10,600,000; of which among 3913·5 cut 329 were of that date $\therefore \frac{3,364,000}{10,600,000} \times 329 = 104 =$ corrected number. Then 41,574,000 half-sovereigns = £ 20,787,000 were coined in the 51 years 1817–67 and a similar correction was applied to the number of half-sovereigns returned out of 1,000 cut.

TABLE XII.

Countries.	Years.	Expenditure per head of Population.								
		Current Coin of Country.			International Money: Grams = *Sols* or Half-crowns in Gold.					
					On the assumption that the Expenditure is discharged in Standard Gold (·91531 fine).		On the assumption that the Expenditure is in depreciated Paper Currency.		Mean of the results in cols. 4. and 5	
Cols.	1.	2.	3.			4.		5.		6.	
						Sols.	*Cents.*	*Sols.*	*Cents.*	*Sols.*	*Cents.*
	United Kingdom	1866-7	2 £'s	4 shillings	5½ pence	17	78				
(*a*)	America - -	1867-8	18 dollars	58 cents	–	31	41	23	53	27	47
	France - -	1868	52 francs	6 cents	–	16	51				
	Prussia - -	1868	6 thalers	19 silver groschen	–	7	73				
(*b*)	Austria - -	1868	12 florins	67 cents	–	9	92	8	59	9	25
	Spain - -	1867-8	15 escudos	98 decimes	–	13	18			*11	86
	Portugal - -	1868-9	5 milreis	249 reis	–	9	32				
(*c*)	British India -	1866-7	3 rupees	7 annas	2 pice	2	67				
	Holland - -	1867-8	27 florins	61 cents	–	18	40				
(*d*)	Russia - -	1868	6 roubles	24 copecks	–	8	18	6	9	7	53
	Sweden - -	1867-8	9 riksdalers	89 öre	–	4	32				
(*e*)	Italy - -	1868	38 lire	69 centimes	–	12	27	10	67	11	47

The Table may be read thus: The expenditure of France was at the rate of 16 *Sols* (grams) of gold (half-crowns), and 51 cents per head of population.

(*a*) In 1868 one gold dollar was worth 1·335 paper dollars, and 1 paper dollar was worth ·74906 gold dollar. (*See* Seyd, p. 346.)

(*b*) £1 = 10·215 silver florins = paper florins 11·80. (*See* Seyd, p. 323.)

(*c*) The mint par between Calcutta and London 1 rupee = 22·6088 pence: in this Table gold rupee = $\frac{1 \text{ gold mohur.}}{15}$

(*d*) The half imperial which is worth in gold 16·384 shillings equal 5·15 roubles, consequently exchange equals 1 rouble = 38·175 pence; and at 77 shillings and 10½ pence per ounce, the Bank price here, it is 38·055 pence. The exchange lately stood at 32 pence per rouble, consequently a paper rouble is worth only 32 pence. (*See* Seyd, p. 332.)

(*e*) The gold at a premium ranging from 12 to 18 per cent. in 1868. (*See* Seyd, p. 303.)

* For Spain one tenth has been deducted for depreciation of paper.

Note.—The currencies of the United States of America, of Austria, Russia, and Italy are depreciated by the excessive issues of inconvertible paper money. Part of the expenditure incurred in paying parts of the public debt and in other ways is discharged in gold, but the greater part is paid in depreciated paper. The valuation in this Table proceeds on the assumption that the expenditure is in a currency at *par*, equivalent to gold of its nominal value. This is therefore a maximum value, and a minimum is obtained by reducing the value thus determined to the value in gold of equivalent amounts of depreciated paper. Thus the public estimated expenditure of the United States will not exceed 122,220,000 international ten gram gold coins, nor, as gold was at 133·5, be less than $\frac{122,220,000}{1·335}$ = 91,550,000 ten gram gold coins. It would require all the skill and all the knowledge of the American Secretary of the Treasury to determine the exact values lying between those extremes. The same remark applies with greater force to Austria, Russia, and Italy. As regards Spain the depreciation of the paper varies in different localities, and the exchanges afford no help. The mean of the maximum and minimum values are inserted in Col. 6. as mere approximations.

	International Cents.		English Coin.
centigram of standard gold = 1 cent.	100 cents	=	Half-crown.
	80 cents	=	Florin.
	40 cents	=	One shilling.
	20 cents	=	Sixpence.
	10 cents	=	Threepence.

Reference to authorities:

(*a*) Appendix to Report of the Royal Commission on International Coinage, p. 227.

(*b*) According to the Master of the Mint Fred d'or contains 6·0323 grams of fine gold: a thaler has been taken at $5\frac{4}{9}$, equal to one Fred d'or.

(*c*) It has been assumed that 10·214 Austrian silver Florins equal £1 (English).

(*d*) The silver rupee, calculated at the par of exchange, is worth ·753648 grams of gold. (*See* Seyd.)

(*e*) A guilder, taken at 20*d.* English, equals ·6102 in grams of fine gold; 20 guilders make 12·204 grams. The Master of the Mint makes a double William 12·112.

(*f*) The Master of the Mint states that the half imperial of 5 roubles contains 6 grams of fine gold.

(*g*) The value of a gram of fine gold is £·1365654, consequently the value of 1·200 grams is equal to ·16387848 = 3·27757*s.* = 39·3308*d.* The par of exchange between London and St. Petersburgh is 38·175*d.*

(*h*) The Master of the Mint makes a gold ducat contain 3·400 grams of fine gold. A gold ducat contains $8\frac{1}{2}$ rix dollar pieces, consequently one rix dollar would contain 4-tenths of a gram of gold.

Note.—Where the double standard now prevails, as in France and the United States, or the silver standard, as in Holland, Germany, and Scandinavia, the values in gold cannot be precisely expressed.

Decision of the Hague Congress in favour of expressing Values for Statistical Purposes in Francs and in Decagrams of Gold 9-tenths fine. (*Extract from Official Report.—First Section.*)

(The *decagram* of gold is worth very nearly 25*s*.)

M. Farr. J'ai l'honneur de vous soumettre encore la proposition suivante : *Qu'en ce qui concerne les monnaies, les auteurs des divers travaux veuillent bien étudier la question s'il convient de donner les valeurs en décagramme d'or dont neuf-dixièmes de fin.*

M. le President. Nous avons déjà décidé que nous donnerions les valeurs en francs.

M. Farr. Le Congrès a adopté le système métrique et nous sommes tous d'accord à cet égard. Mais pour les monnaies il ne pouvait en être de même. On a recommandé à divers gouvernements de modifier en quelques points leur système monétaire afin d'obtenir des rapports très-simples entre les monnaies des différents pays. Ainsi l'Angleterre frapperait un souvrain ayant la méme quantité d'or fin qu'une pièce de vingt-cinq francs en France ; l'Amèrique rendrait aussi le dollar comparable au franc, et ainsi de suite, afin d'avoir toujours un rapport facile entre les diverses monnaies.

Cette question a produit beaucoup d'agitation en Angleterre. On y a proposé de diminuer le poids de l'or du souverain et de lui donner le poids de la pièce de vingt-cinq francs. Cette proposition a été faite lors de la convention de Paris. Dans cette convention, où vingt États divers se trouvaient représentés, on a décidé qu'on adopterait l'or comme étalon commun, en proposant pour point de départ la pièce d'or de cinq francs. M. Michel Chevalier a fait une proposition que je crois très-importante, celle de prendre comme unité monétaire le décagramme d'or. * * * * (*See* previous pages.)

M. Wolowski. Nous ne saurions discuter ici la question monétaire. Ce n'est pas une de ces questions qu'on puisse introduire dans un Congrès au moment où l'on est près de se séparer. C'est un grave problème sur lequel il y a beaucoup à dire.

Mais M. Farr nous fait une proposition plus simple à l'égard de laquelle je crois qu'il n'aurait pas eu besoin d'entrer dans la discussion de la question monétaire. Il s'agit d'un moyen d'évaluation pour le monde scientifique, qui s'occupe du rapprochement des différentes données statistiques ; il demande que l'on prenne pour ces évaluations une unité monétaire qui serait le décagramme d'or. Quelle que soit mon opinion sur le fond de la question monétaire, au sujet de laquelle je n'aurai peut-être pas le bonheur de me rencontrer avec M. le docteur Farr, je ne m'oppose pas à l'adoption du décagramme d'or comme unité convenue pour les évaluations statistiques.

Je crois inutile d'entrer dans le fond de la question et de parler des résolutions qui ont pu être prises provisoirement de tel ou tel côté. Je me borne à donner mon adhésion, restreinte dans ces termes, à la proposition de M. le docteur Farr.

M. Visschers. J'appellerai l'attention sur une brochure très-intéressante qui vient de paraître à Berlin et qui est due à M. Eug. Nothomb, fils du ministre plénipotentiaire de Belgique. Cette brochure rentre tout à-fait dans les idées de M. Farr, et je crois qu'il est bon de la signaler ici.

M. le Président. Je mets aux voix la proposition de M. Farr.

M. Ruggles. Je propose d'ajouter que, quant aux États-Unis de l'Amerique du Nord, on prendra pour unité le dollar.

M. le President. Nous avons déjà décidé que chacun pourrait indiquer les valuers en monnaie de son pays, mais qu'on ferait en même temps la réduction en francs.—(*La proposition de M. Farr est adoptée.*)

Note.—The United States of America and all the chief States of Europe were represented at this meeting of the International Statistical Congress, which sat under the Presidency of the Home Minister of the Netherlands. M. de Baumhauer presided over this section.

APPENDIX C.

REMARKS SUBMITTED TO THE CONSIDERATION OF THE ROYAL SANITARY COMMISSION BY THE REGISTRAR GENERAL OF ENGLAND AND WALES.

General Register Office, Somerset House,
6th July 1869.

Having perused the memorial and memorandum presented to Her Majesty's late Government asking for the appointment of this Royal Commission, I see that the first points referred to as requiring reformation relate to my department.

I therefore take the liberty of proposing to make the following general statement.

Although the registration of births is not so complete as is desirable there are not many deaths that remain unrecorded, inasmuch as burial must follow death, and when, previous civil registration of death not having been effected, the officiating minister buries a corpse without being furnished at that time with a certificate that the death has been recorded in the civil register, he must under a penalty of 10*l.* give notice to the registrar of the fact, and thus the registration of deaths is nearly complete, as coroners also send to the registrar, to be recorded, the verdicts of juries in cases where inquests have been held.

So also the registration of marriages is complete, every marriage almost without any exception being forthwith recorded and attested by at least five signatures, the parties married signing, and the officiating minister or the civil registrar and two witnesses.

With respect to births, I am sorry to say that registration is not complete, and I see no machinery that can be devised to make that perfect, for, although baptism and vaccination ought quickly to follow, they do not necessarily do so, and there is no speedy subsequent act, like burial after death, or like circumcision among Jews and Mahometan males, which can be used for making registrars acquainted with *every* birth that occurs.

The statute may make it imperative under a penalty for parents to give notice, and that would be a great improvement, but in densely populated districts that law, like many others, may be evaded with impunity and, where secrecy is desirable, as in many cases of illegitimate births, I know of no means of forcing all parents to give notice ; in large towns no registrar, however painstaking, zealous, and inquisitive, can ascertain *every* birth that occurs, if notice is designedly neglected to be given and if concealment is determined upon.

It may be taken for granted that almost all deaths are registered, and it will not be supposed that many are omitted when I state that in this part of Great Britain alone I register nearly 1400 deaths every day, and that during the last 30 years about 13 millions of names of the deceased in England and Wales have been indexed ; the indexes at Somerset House of the names of all born, married, and died since 1837 being 40 millions.

Civil registration of death is effected by a person who was present at death or who was in attendance, who informs the registrar of the particulars to be recorded, attesting by his signature in the register the truth of his statement ; if he wilfully makes any false statement of any one particular he is liable to the pains and penalties of perjury, civil registration being a more serious and important matter than the ecclesiastical registration of baptisms and burials, where there is no penalty for a wilfully false statement.

Amongst other particulars is recorded the cause of death, and in the first years of registration these fatal diseases were very incorrectly entered.

Medical practitioners, however, were invited by the Royal Colleges of Physicians and of Surgeons of London, and by the Society of Apothecaries in 1837 to furnish written statements of fatal diseases to be given to informants for entry in the register.

After some years' experience I found that these causes of death were still badly recorded, and in 1845 I circulated amongst the whole of the medical profession in England and Wales a printed statistical nosology explaining the best mode of recording causes of death, and I also issued, and I continue to do so to the present time, books containing printed certificates to save medical men time and trouble in filling up written statements, and I ordered that in the register books of deaths a distinction should be made in cases where a written statement was produced by the informant from a legally qualified medical practitioner by appending in the same column the word "*certified*," and in cases where no such cause of death was recorded under the hand of a properly qualified practitioner the words "*not certified*" are to be added to the fatal diseases.

In many instances they are now well registered; in other instances medical men refuse to take the trouble of writing certificates of fatal diseases, and consequently there are still sometimes lamentably senseless and useless statements made by ignorant and uneducated informants. For although in Scotland by a later statute medical men are compelled under a penalty to furnish these written certificates, they are not in England and Wales.

The Scotch think this a great hardship, but myself, considering the privileges enjoyed by legally qualified medical practitioners, and seeing that in using the knife and in administering poisons they have free scope and no limit to their discretion, having every credit given them for the exercise of the highest skill although death may not be arrested, and being seldom subjected to investigating inquiry as to the precise treatment of their patients, differing in this respect from quacks, herbalists, &c., I cannot see that there is any hardship in a medical man being required to state the disease which in his opinion killed the patient who died under his treatment.

If a general practitioner thinks that he ought to be paid for filling up the printed certificate with which I furnish him, let him in his last account sent to the representatives of the deceased, after the last box of pills, the last lotion, the last narcotic, add the charge of half-a-crown or a few shillings for written statement of cause of death.

Practically, although in London and in some large towns a great percentage of fatal diseases is well recorded, many causes of death in many parts of England and Wales are registered in an unsatisfactory manner.

This arises from three causes,—1st. Medical men decline to take the trouble of giving written statements. 2d. Some medical men abstain from stating in direct terms the exact disease, being desirous of not hurting the feelings of mourning relatives who dislike such words recorded and made public as mania, syphilis, hydatids, scrofula, &c. 3d. Many persons do not employ in their last illness legally qualified medical practitioners.

As a remedy, it appears from the proceedings of the British Medical Association, that, generally speaking, it is the desire of pure physicians, pure surgeons, and general practitioners, that a large number of their profession should be appointed to public offices, and that in all cases where their services before death have not been in requisition, one of their body should in all parts of England and Wales enter those families and, before burial or civil registration be permitted, inspect the corpse and investigate and report the cause of death.

I do not suppose that this Royal Commission will be prepared to recommend that every person who is ill *must* seek the attendance of a legally qualified medical practitioner. However desirable the British Medical Association may naturally consider such a course to be, I can hardly think

they wish to make it penal by statute to consult a chemist, a homœopath, an herbalist, a bonesetter, or to have no advice at all, as is the custom with a sect calling themselves "*Peculiar People*," who hold strange opinions upon this point, and whose privilege to act upon those opinions was confirmed last year in a court of law. I have known bonesetters and unqualified practitioners, like Harrup of Brighton, and Hutton of Watford, and Melville of Newcastle-on-Tyne, far superior in their special art to some country doctors; and 30 years ago I myself employed one with great success. At that time in Cumberland there was a family of them of the name of Denison of Stainton, noted for their skill, keeping three horses and perpetually called upon to scour the country professionally in a circle of 50 miles round their residence. I have known pure surgeons *secretly* recommending that they should be consulted.

I have lately seen a case where a man after a severe accident was said to have sprained his shoulder; he suffered much for two years, during which time he was perpetually consulting the most eminent pure surgeons and pure physicians in England, all of whom failed to do him any good or to afford him any relief. He got gradually worse and lost almost entirely the use of his arm, being unable even to write, when he consulted a bonesetter, who immediately saw the real nature of the injury, knew how to treat it, and in a very short time entirely cured him. This same bonesetter has lately, within my knowledge, cured two other persons who had been lame and suffering for years, and had derived no benefit from the advice of the most distinguished legally qualified medical practitioners.

The proposal above referred to and suggested for the consideration of this Royal Commission would, in my opinion, cause in many instances great and needless additional distress to grieving families, and in some cases be considered an intolerable hardship in this free country.

It would also cause heavy expenditure, for it would be necessary to nominate to public offices many hundreds of medical men. A zealous sanguine statist tells me he considers 50,000*l.* annually paid to these doctors a mere trifle, compared to the advantages the public will derive from their services. And in widely spread extensive districts, in Wales for instance, and in the Northern Counties, funerals would be unnecessarily and most inconveniently delayed in cases where beyond doubt no inquiry was needed, and where there had not existed an iota of suspicion that anything improper had occurred previous to the decease.

A coroner in Somersetshire who belongs to the medical profession, when deaths occur from natural causes and the deceased have not been attended by legally qualified medical practitioners, announces his intention of *always* holding inquests, however unnecessary they may seem to be, and however hurtful to the feelings of the relatives and friends of the deceased. I consider this an arbitrary and cruel proceeding on the part of this medical coroner, his object being thus to compel every one, however poor, when ill, to seek the advice of members of his own profession.

There have been instances where medical practitioners have, on the report of designing relatives, believed that death has ended the suffering of their patients, whose recovery they despaired of, and without personally ascertaining the fact, trusting the statements made to them, they have given written certificates of the cause of death for insertion in the register, when actually the persons reported dead were still alive!

I do not now recognize certificates from medical men when they state that they "*have been informed*," or that "*they believe*" that their patient is dead. I must have the fact positively reported by them as having actually occurred, I presume, within their own personal knowledge, or on such evidence as they know they can give entire credence to.

There have also been instances where entries of deaths entirely fictitious have been made, registrars being deluded by false statements of in-

formants, sometimes supported by forged certificates as to the fatal diseases purporting to be signed by medical practitioners.

But what can prevent such cases occurring, when the astute minds of men like Barber and Fletcher are devoted to iniquity of this sort, sufficiently skilful to deceive and rob even the Bank of England, who in these matters are notorious for their caution ?

Although these flagitious cases, when exposed and tried in courts of law, are much adverted to, and tend to bring discredit on the system of civil registration of deaths, it occurs to thoughtful minds, with the exception of these few cases above referred to—not many out of the 13 millions of deaths recorded since 1837—how well and how quietly, and with what little trouble these millions of deaths are recorded from day to day in registers carefully indexed and accessible to the public in the immediate neighbourhood, placed in fireproof repositories in 650 different register offices spread over every part of England and Wales ; and then again with copies of these registers concentrated in the spacious vaults of Somerset House, again carefully indexed, in order that the public at short notice may obtain in the Metropolis sealed copies, which the statute makes evidence of the entry without further or other proof. Of these certified copies I gave in 1868 about 15,000.

I maintain that the system of civil registration, introduced and organized by Earl Russell 33 years ago, has been found generally to answer well. I do not claim for it perfection, being myself aware of two or three, or perhaps more points, respecting which I can indicate to Her Majesty's Government that reformation is desirable; but upon the three points connected with my department which the memorialists prominently represent as objectionable, I do not advocate the changes they desire to introduce.

First, I am averse to their proposal, that in every district there should be medical officers appointed to investigate causes of death in every case where legally qualified medical practitioners had not been in attendance, and that no funeral should be allowed to take place, and no civil registration of death be effected, without the sanction of such medical officer, not only in towns but in secluded hamlets and in remote cottages.

Secondly, I object to the proposal, that I am to become acquainted with and record every attack of disease which assails each individual of the 22,000,000 inhabitants of this part of Great Britain, infants, adults, and aged, from which they recover—a national registration of all diseases not fatal.

Thirdly, I am opposed to the project, that still-born children should be registered.

I well know how great is the demand for statistics in this age, and that learned and distinguished statists are numerous, who earnestly devote their time to the study of returns and tables, and calculations of averages and estimates upon every imaginable subject, and that there are many associations who spend pleasant days in social meetings in various cities, in discussing the results obtained and published by their coadjutors.

But I did not expect to live to see the day that I should be called to appear before a Royal Commission and asked to register all the complaints which do not kill but only annoy and afflict the 22,000,000 of inhabitants of England and Wales. I had thought that with respect to diseases not proving fatal the information already obtained would have been deemed sufficient to satisfy the most inquiring of minds as we have the reports of hospitals, dispensaries, infirmaries, lunatic asylums, reformatories, prisons, workhouses, army and navy hospitals, all of which might be tabulated and published, amounting, it is said, to five millions of separate cases annually, and we read of the results obtained under the Contagious Diseases Act, and are made acquainted from week to week through the medical journals with peculiar cases occurring in private practice.

How are my registration officers to perform this proposed duty? Where is the line to be drawn? Nearly 800,000 women every year in England and Wales bear children; is each of these cases to be particularly recorded with their varying specialities? And are the ailments of these hundreds of thousands of newly born infants to be registered? Are inquiries to be made and facts recorded respecting the catarrhs and headaches, and indigestions many people occasionally suffer from?

When the registrars have noted the puerperal cases and the infantile diseases not proving fatal, they will have a delicate and a difficult task when they intrude their inquiries into the complaints of adults.

I suppose they are to make use of the new nomenclature of diseases printed in five languages lately published by the Royal College of Physicians of London.

That learned body have spent 10 years in its composition, and 60 distinguished persons, celebrated for their peculiar qualifications for preparing and bringing to completion so important and valuable a work, have devoted their time and attention to it. It is to be hoped that, like the new pharmacopœia, this remarkable nomenclature of diseases will be in the hands of every medical practitioner and every registrar of births and deaths, and soon be generally used.

In ascertaining some of the common ailments of adults careful treatment and great tact will be necessary. In large towns, for instance, how difficult it will be in cases of syphilis in males to ascertain whether it is primary or secondary, or whether only gonorrhœa simplex should be recorded with full detail of all accompanying distressing symptoms. Then, with regard to females, how are my registrars without making most annoying inquiries to become acquainted with every case of hysteralgia, or chlorosis, or dysmenorrhœa?

Again, how tedious will be their task when they investigate the complaints that we the aged and infirm are suffering from; what afflicting details will be recorded of our rheumatism, our gout, our sciatica, our failing memory, our infirmity of gait, our blindness, our deafness, our weakened limbs and joints, our diseased circulation, our gravel, our dyspepsia, our amentia, our stone, and our many various sufferings before we reach the end.

Whatever my successor may be equal to I consider that I cannot undertake to execute in a satisfactory manner this proposed new duty with respect to the registration of cases of disease not proving fatal.

Then as to the third point which the learned and accomplished members of the British Medical Society and the Social Science Association bring forward as a deficiency to be remedied in my department, that at present still-born children are not registered.

I am of opinion that neither with respect to marriages, nor births, nor deaths are we in this land of liberty to be hampered and perplexed with all the annoying requirements which are forced upon the people in those European states where the code Napoleon is introduced.

There are some minds dwelling on the subject of miscarriages, abortions, children born dead, who would like to know by means of statistical returns how many there are of such occurrences in every year, in every month, on every day.

I have never yet heard of any real useful object to be gained by this inquiry. We know from printed reports how it is conducted in Paris, where in the four months of March, April, May, June 1868 returns were published respecting—

3	fœtuses between	1 and 2 months.
21	„	2 and 3 months.
48	„	3 and 4 months.
108	„	4 and 5 months.
144	„	5 and 6 months.

Many more at 7, 8, and 9 months. The sex of some, as might be expected, could not be determined, and with respect to 377 others born dead in those four months the exact period of gestation could not be ascertained and recorded.

In Paris in 12 months ending 30th June 1868, 4387 still-born children were registered. Looking at the difference of population according to that proportion the number in England and Wales in each year would be about 50,000, nearly a thousand every week.

Moreover, every one would be subject to the inquiry ; princesses and peeresses, prostitutes and paupers, and the persons whose duty it would be to make these searching investigations are not always the best qualified. Registrars of births and deaths are not nominated by me but are elected by Boards of Guardians, men of all ranks and professions, from clergymen of the Church of England to tailors and publicans. Fancy a curate forced by statute to make this inquiry of a pauper prostitute, or a rough mannered beershop keeper or farrier asking a delicate duchess how many months after conception her abortion had taken place ?

I consider these inquiries as to the exact period of gestation most indelicate and disgusting, and I see no compensating advantage to be derived from them ; they would seriously injure our earnest attempts to obtain a complete and perfect registration of all children born alive.

Many respectable modest women would dread these nasty investigations and would look with horror on the visit of the inquisitive registrar. Myself, I should prefer being compelled by Act of Parliament to register the birth of every living calf, or every living foal, or even a living colt the foal of an ass rather than the miscarriages and abortions of women, and the entry into the world of dead human fœtuses, many of which are in a state of decomposition. A latent scintillula of usefulness might probably exist in recording the births of live animals, and it would certainly be a novelty, agreeable to some, to have a list of all the asses in England and Wales, the number of whom may be found to be greater than perhaps some people expect. For the above reasons, therefore, which I fear I have stated at too great length, I urgently deprecate the adoption of the three changes in my department which these learned societies press on the notice of this Royal Commission. My opinions are fixed and not to be shaken, and taking a practical view of the three proposed measures I consider them, however well they may look upon paper, neither wise, just, or beneficial, but on the contrary undesirable, Utopian, and unattainable.

But I must humbly add that it sometimes occurs to me that I may be wrong and the memorialists right, for, when most positive, we are sometimes most wrong ; at all events I rest satisfied that the whole subject will be well considered and investigated by this Royal Commission, and a right judgment ultimately arrived at.

If it be decided that Parliament should be invited to enact that a record should be made of cases of diseases not proving fatal and of stillborn children, I think that that inquiry would be best conducted under the able superintendence of the medical officer of health attached to the Lords of the Privy Council.

Finally, I must remark that the establishing of civil registration in 1837 was considered necessary from the negligent manner in which parochial registers were made and preserved by ecclesiastics, and because registers kept by non-conformists were not considered of value as evidence in courts of law, and with a view to centralize in the Metropolis the records of these events, simple in their nature, but immediately important to the persons concerned, affecting in many respects the interests of their kinsmen, their neighbours, and the community at large.

For all the rights of succession to property depend on the legitimacy of birth, the validity of marriage, and proof of death. From inability to produce a register of the marriage of his father and mother a British peer

was lately prevented from taking his seat in the House of Lords for many months.

The events I speak of used in early days to be recorded by the monk in his cartulary, and by our Protestant forefathers in the family Bible; now hundreds of thousands of these events are annually recorded in England and Wales on evidence which, if it be false and given wilfully, is punishable as perjury; and printed indexes are prepared in each quarter of the year rendering to the public easy access to 40 millions of names for legal purposes.

This was the great object which the legislature had before them in establishing 32 years ago this system; and whatever blame may be attributed to my department by the learned societies who have pressed upon Her Majesty's government this inquiry, and by witnesses who have been examined by this Royal Commission, I claim not for myself but for the distinguished head of the statistical branch, Dr. W. Farr, the credit of supplementing the information to be derived from this enormous accumulation of recorded events, and making known the results in returns and reports which are popular and really useful, showing practically the advantages the public derive from attention to drainage, dwellings not too crowded, access to pure water; in returns giving immediate daily publicity as to the exact locality where epidemics rage, when pestilence and cholera visit the country; in returns from which life tables have been framed showing how in former days Insurance Companies exacted from the public premiums too high, not calculated on the proved rate of mortality amongst the people.

The learned societies I allude to may find fault with my department and the medical profession may be urgent advocates for the appointment of hundreds of their body to official positions in every part of the country; but whatever well considered changes and reforms may be made in my office hereafter by my successor, who will be superior to me in ability, (and several changes and several reforms I know to be advisable), I hope without unduly magnifying and extolling my position I may have the satisfaction of thinking that I have not presided over the General Register Office during the last 27 years fruitlessly, inasmuch as evidence constantly reaches me that in every country in Europe and throughout America and all our colonies our labours are highly appreciated, as affording more extended and more useful information upon such subjects than is given in any other country in the world.

GEORGE GRAHAM,
Registrar General.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 297) *and "Index of certain Towns"* (page 307).

A

INDEX OF SUB-DISTRICTS.

[this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G as "Grinstead, East;" St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to the order in which it appears in the arrangement of the Districts in the Tables of Abstracts; thus, Abbey Holme (569; 2) is the 2d Sub-District of the Wigton District, No. 569.]

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S THIRTY-FIRST ANNUAL REPORT AND APPENDICES.

PAGE

AGES; of Persons married in 1868 vii

Mean Age at Marriage ix

Deaths of Males and Females registered at different Ages in England in each of the Years 1838–68. (Tables 17, 18.) . . . xvii–xviii

Mortality of Males and Females at different Ages in England in the Years 1838–67. (Tables 19–22.) . . . . . xix–xxii

of 237,268 Persons married in 1868, distinguishing Bachelors, Spinsters, Widowers, Widows 26–27

at Death of Males and Females registered in 1868 in Divisions, Counties, and Districts 98–119

at Death of Males and Females in England registered from different Causes, in 1868 120–125

at Death of Males and Females in England registered from different Supplemental Causes, in 1868 126–129

at Death of Males and Females in London registered from different Causes, in 1868 130–135

AREA in Statute Acres of each Division, County, District, and Sub-district . 28–82

ARMY; Strength and Mortality in the Army at home and abroad . . xxix

Annual Rate of Mortality per 1000 in Great Britain, England, France, Austria, and Italy, including the Deaths of Soldiers *at Home and Abroad*, 1857–68. (Table 32.) . . . xxx

Average Strength of the British Army at Home in 1868. (Table 33.) xxx

Mortality of the Army at Home in 1868. (Table 34.) . . xxx

Average Strength of the British Army Abroad in each of the Years 1865–68. (Table 35.) xxxi

Number of Deaths in the British Army at Home and Abroad, 1865–68. (Table 36.) xxxi

Annual Rate of Mortality per 1000 amongst Officers and Men in the Army Abroad, 1858–68. (Table 37.) xxxi

Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table 38.) xxxii

Deaths in Army Abroad of Officers and Men belonging to England and Wales and to Great Britain, 1858–68. (Table 39.) . xxxii

AUSTRIA; Estimated Population in middle of the Years 1853–68. (Table 28.) xxvii

Number, and Proportion per 1000 to Population, of Marriages, Births, and Deaths, in each of the Years 1853–68. (Table 29.) . xxviii

Annual Rate of Mortality per 1000 in the Austrian Army, 1857–68. (Table 40.) xxxii

PAGE

BIRTHS registered in England, in each Year, 1838–1868. (Table 1.) . . i

proportion to Population in each Year, 1838–68. (Table 2.) . ii

Legitimate and Illegitimate in England in the Years 1845–68, and Proportion of Males to Females. (Table 9.) x

in Counties, in 1868. Numbers, Legitimate and Illegitimate, of the two Sexes; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 10.) xi

in 1868 . . . . . .

proportion to Population in different parts of the Country . . x

proportion of legitimate Births to married women, and illegitimate Births to unmarried women x

proportion of Male and Female Children born in the several Counties of England during each of the Years 1859–68. (Table 11.) xii

proportion to Population in Counties for each of the Years 1858–68. (Table 12.) xiii

of the two Sexes xi

proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838–68. (Table 13.) xiv

registered in England, and proportion to Population, in each Quarter of the Years 1838–68. (Table 14.) xiv

in the four Seasons xii

out of wedlock . . . . . x, xiii

in quarter ending March 1868 xlv

in quarter ending June „ xlix

in quarter ending September „ lii

in quarter ending December „ lv

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1868 28–82

excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1868 28–82

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1868 . . . 86–89

of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1868 90–93

BIRTH-RATE in different parts of the Country in 1868 x

in Counties in each of the Years 1858–68. (Table 12.) . . . xiii

in England in each Quarter of the Years 1838–68. (Table 14.) . xiv

BURNS AND SCALDS; Deaths and Mortality at different Ages, in the Years 1848–68. (Table 19.—App.) 230

CAUSES of DEATH of Males and Females in England, at different Periods of Life, in 1868 120–125

(Supplementary Table) of Males and Females in England at different Periods of Life, in 1868 126–129

of Males and Females in London at different Periods of Life, in 1868 130–135

of Males and Females in England, and in each of the Divisions and Counties, in 1868 136–159

(from certain zymotic and other Causes) in 1868, in the Divisions, Counties, and Districts of England 160–171

Dr. Farr's Letter to the Registrar General thereon . . . 197

CAUSES of DEATH—*continued.* PAGE

Necessity of getting accurate information thereon . . . 197

registered in England in each of the Ten Years 1859–68. (Table 10.—App.) 218–220

Mortality from the several Causes in each of the Years 1852–68. (Table 11.—App,) 221–223

proportional Numbers dying from each Cause in 1868. (Table 12. —App.) 224

Mean Annual Rate of Mortality from different Causes during three periods of Five Years, and in 1868. (Table 13.—App.) . 225–226

in England, in 1868, arranged in the order of Mortality. (Table 14. —App.) 227

CHILDBIRTH; fatal diseases of 200

Deaths in 1868, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table 15.—App.) . 228

Deaths of Women in 1868 who were returned as pregnant, classed under certain Diseases. (Table 16.—App.) 229

Deaths of Women from Metria and Childbirth in the 22 Years, 1847–68, and proportional Deaths of Mothers to Children born alive. (Table 17.—App.) 229

CHOLERA; the Spanish Quarantine against English Vessels . . . liv

COINAGE; Report to International Statistical Congress at the Hague by Dr. Farr 235–284

COLLIERY ACCIDENTS in 1868 xxi

CONSTITUTIONAL DISEASES 200

CORONERS' RETURNS still incomplete and unsatisfactory 201

CYNANCHE MALIGNA and DIPHTHERIA; Deaths in England at different Ages in each of the Years, 1855–68. (Tables 1. and 2.—App.) . 214

DEATHS registered in England in each Year, 1838–1868. (Table 1.) . . i

proportion to Population in each Year, 1838–68. (Table 2.) . ii

in 1868 xvi

registered in England at different ages (Males and Females) in the 31 years 1838–68. (Tables 17, 18.) . . . . . xvii–xviii

registered in England in each Quarter of the Years 1838–68. (Table 24.) xxiv

proportion to Population xvii

Meteorology and Mortality . . . . . xviii–xix

in the four Seasons xviii

of the two Sexes xix

Mortality in different localities xx

Colliery Accidents in 1868 xxi

Mortality in the Eleven large Towns xxiii

Mortality at different Ages of Males and Females xxiii

proportional Number in each Quarter to 1,000 Deaths in the average Quarter, 1838–68. (Table 23.) xxiii

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1868 28–82

in 1868 in the principal Public Institutions in London . . . 83–84

registered in each of the Four Quarters of 1868 (distinguishing Males and Females), in Divisions and Counties 94–97

of Males and Females at different Ages registered in 1868 in Divisions, Counties, and Districts 98–119

PAGE

DEATHS FROM DIFFERENT CAUSES. (*See* CAUSES OF DEATH.)

DEATH-RATE of Males and Females in each of the Years 1838–68. (Table 15.) xv

in Counties in each of the Years 1858–68. (Table 16.) . . xvi

in each Quarter of the Years 1838–68. (Table 24.) . . . xxiv

DEATH RATE; per 1000 at different Ages of Males and Females in England in the years 1838–67. (Tables 19, 20, 21, 22.) . . . xix–xxii

Average Annual Rate in the 10 years 1851-60 in the Divisions, Counties, and Districts of England 160–171

from the several causes to 1,000,000 living in each of the years 1852–68. (Table 11.—App.) 221–223

Mean Annual Rate from different Causes during three periods of five years, and in 1868. (Table 13.—App.) 225–226

(*See also* DEATHS.)

DEATHS and STATE of the PUBLIC HEALTH in quarter ending March 1868. xlvii

in quarter ending June „ . l

in quarter ending September „ . liii

in quarter ending December „ . lvi

DEVELOPMENTAL DISEASES 200

DIARRHŒA; necessity for a careful study of 199

DIPHTHERIA and CYNANCHE MALIGNA; Deaths in England at different Ages in each of the Years 1855–68. (Tables 1. and 2.—App.) . 214

DISEASES (*See* CAUSES OF DEATH).

DISTRICTS: changes in the constitution of, during 1868 172

Alphabetical Index of 293–296

DIVISIONS of England: Average Annual Rate of Mortality in the Eleven Divisions in the 10 Years 1851–60, and in the Four Quarters of 1868. (Table 46.) lix

DIVORCES; Marriage of Divorced persons in 1868 v

EDUCATION; progress of, as indicated by Signatures to Marriage Registers . ix, xxxvi–xliv

EMIGRATION in 1868 ii

from the United Kingdom, in each of the Years 1815 to 1868 (Table 56.) lxx

from the United Kingdom in 1868, distinguishing the Destination, Sex, Age, Condition, Occupation, and Origin of the Emigrants. (Tables 57–58.) . . . . . lxxi–lxxii

ENGLAND AND WALES; Summary of results of Registration—

in Year 1868 . . . . . ii, xxxiv

in quarter ending March 1868 . . . xlv

in quarter ending June „ . . . xlviii

in quarter ending September „ . . . li

in quarter ending December „ . . . lv

Estimated Population of both Sexes in the middle of each of the Years 1801–1870 (*excluding Army, Navy, and Merchant Seamen Abroad*). (Table 60.) lxxiv

ERYSIPELAS: Deaths at different Ages in England in the Years 1862–68. (Table 9.—App.) 217

PAGE

FARR, WILLIAM, M.D.; Letter to the Registrar-General on the Causes of Death 197

ECUNDITY; a remarkable case of early xv

FEVER; Ages of the Persons who died from Fever (Typhus, Typhia, and Typhinia) in the Year 1868. (Table 5.—App.) 216

Deaths in England at different Ages from Fever, in the 21 Years, 1848–68; and Annual Rate of Mortality. (Table 6.—App.) . 216

Annual Number of Estimated Cases, and of Deaths at different Ages, in the 21 Years, 1848–68. (Table 7.—App.) . . . 216

Deaths registered, Mortality, and Proportional Number to 1,000 Deaths in each of the 19 Years, 1850–68. (Table 8.—App.) . 217

FOREIGN STATES; Number and Proportion to Population of Marriages, Births, and Deaths xxvi

FRANCE; Estimated Population in middle of the Years 1853–68. (Table 28.) xxvii

Number, and Proportion per 1000 to Population, of Marriages, Births, and Deaths, in each of the Years 1853–68. (Table 29.) . xxviii

GREAT BRITAIN; Area, Estimated Population, Marriages, Births, and Deaths in 1868. (Table 25.) xxv

Proportion per 1000 of Marriages, Births, and Deaths to Population in 1868. (Table 26.) xxv

HEALTH; State of the Public Health in quarter ending March 1868 . xlvii

in quarter ending June „ . l

in quarter ending September „ . liii

in quarter ending December „ . lvi

ILLEGITIMATE BIRTHS; . . . . . x, xiii

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1868 28–82

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1868 . . . 90–93

(*See also* BIRTHS.)

INFANTICIDE and MURDER; Deaths in England at different Ages during the year 1868 188–189

in each of the Eleven Divisions during the year 1868 . . . 190

INSTITUTIONS; Deaths in 1868 in the principal Public Institutions of London 83–84

INTERNATIONAL STATISTICAL CONGRESS; Report to the Hague Congress on International Coinage, by Dr. Farr 235–284

IRELAND; Area, Population, Marriages, Births, and Deaths in 1868. (Table 25.) xxv

Proportion per 1000 of Marriages, Births, and Deaths to the Population in 1868. (Table 26.) xxv

Estimated Population of both Sexes in the middle of each of the Years 1801–1870 (*excluding Army, Navy, and Merchant Seamen Abroad*). (Table 60.) lxxv

ISLANDS in BRITISH SEAS; Area, Population, Births, and Deaths. (Table 27.) xxvi

ITALY; Population, Number, and Proportion per 1000 to Population, of Marriages, Births, and Deaths, in each of the Years 1863–68. (Table 30.) xxix

PAGE

LEGITIMATE BIRTHS. (*See* BIRTHS.)

LIGHTNING; Deaths in different Districts in each of the 4 Years 1865–68. (Table 20.—App.) 231

LOCAL DISEASES 200

LONDON; Health of, in 1868 lxiv

Births, Deaths, and Rate of Mortality, 1856–68. (Table 51.) . lxv

Deaths in Public Institutions, 1856–68. (Table 52.) . . . lxvi

Deaths and Meteorology, 1849–68. (Table 50.) lxiv

Annual Rate of Mortality in each of the years 1840–68 in five groups of districts. (Table 54.) lxviii

Deaths in 1868 in the principal Public Institutions . . . 83–84

Causes of Death of Males and Females at different Periods of Life in 1868 130–135

MANSLAUGHTER; Deaths in England at different Ages during the year 1868 191–192

in each of the Eleven Divisions during the year 1868 . . . 193

MARINE REGISTER BOOK; Number of Entries in 1868 xxxiv

MARRIAGES registered in England in each Year, 1838–68. (Table 1.) . i

proportion to Population in each Year, 1838–68. (Table 2.) . ii

in 1868. iv

according to different Rites and Forms iv

registered in England in each Year, 1841 to 1868, in Established Church and amongst Nonconformists; showing also the Condition of Persons married. (Table 3.) iii

proportions of Males and Females in England married at different Ages in 1868 relatively to the estimated population at the same Ages. (Table 4.) iv

in England in each Year, 1841–1868; proportion of Minors; of those who signed with Marks; of Widowers and Widows. (Table 5.) v

of Divorced Persons v

Buildings registered for, in 1868 v

Re-marriages vi

of Minors vii

Ages of Persons married vii

Mean age at Marriage ix

Signature of Marriage Registers ix

in Counties of England in 1868; proportion of Marriages to population; of those who signed in Writing, of Minors, and of Re-marriages, to Total Marriages. (Table 6.) . . . vi

in England; Number and Annual rate per 1000 in each Quarter of the years 1838–68. (Table 7.) vii

Number of Buildings registered for the solemnization of Marriages in the Divisions and Counties of England, and on the Register, on 31st December 1868. (Table 8.) viii

in quarter ending March 1868 xlv

in quarter ending June „ xlviii

REPORT.

TO THE

RIGHT HON^BLE. H. AUSTIN BRUCE, M.P.

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, *March* 25, 1870.

SIR,

I HAVE the honour to submit to you a General Abstract of the Births, Deaths, and Marriages registered in Scotland during the year 1869, in conformity with the requirements of the Scottish Registration Act (17° and 18° Vict. c. 80), in order that the same may be laid before Parliament.

As in my former Reports, I have directed that this Abstract should be accompanied by a short explanatory statement as to the health of the population during the year, the diseases which were prevalent, and the causes which seemed to affect the proportions of the Births, Deaths, and Marriages.

From the mode in which we divide Scotland into districts, according to the density of the population, I have been enabled to prove that density of population increases the Births and Marriages nearly in the exact ratio that it increases the Deaths. This is a most important fact, as bearing on the question of sanitary reform, and one to which I wish to direct your attention.

As the period is now approaching when preparations must be made for taking the Census of the people in 1871, and it is desirable to make any inquiries which may throw light on various social questions, I have directed that in this Report there should be given a summary of the various facts which have been ascer-

tained as to the prevalence and supposed causes of illegitimacy in Scotland.

The year 1869 having proved quite an exceptional one, both with regard to its high mortality and its meteorological phenomena, I directed that special attention should be paid to that subject, with the view of tracing the causes which led to the excessive Death-rate. Several additional Tables are therefore added to this Report, with the view of throwing light on the subject.

In terms of the Nineteenth Section of the Scottish Vaccination Act (26° and 27° Vict. c. 108), I have also the honour to submit to you my Fifth Annual Report on Vaccination, containing a general abstract of the number of children born during 1868 who have been successfully vaccinated, who were insusceptible of the vaccine disease, whose vaccination was postponed, who died before vaccination, and the other particulars required by the Statute.

The success of the Scottish Vaccination Act may be said to be nearly as complete as any legislative enactment could effect, inasmuch as 97·5 per cent. of the children born during the year 1868 have been protected by vaccination, or are otherwise accounted for under the provisions of the Statute. Under its operation, also, Small-pox has greatly diminished; so that it may be said, that for the last five years the mortality from Small-pox has been very much lower in Scotland than during any previous period of which we have any knowledge. The introduction of a few important amendments would remove most of the hardships at present complained of, to some of which I have made special allusion in my former Reports.

I have the honour to be,

Sir,

Your obedient Servant,

W. PITT DUNDAS,

Registrar-General.

REPORT TO THE REGISTRAR-GENERAL,

BY JAMES STARK, M.D., F.R.S.E.

SIR,

THIS Report refers to the Births, Deaths, and Marriages registered during the year 1869 in the 1016 districts into which Scotland was that year divided for the purposes of registration, and also to the vaccination of the children whose births were recorded during the year 1868.

113395 Births, 75789 Deaths, and 22083 Marriages were entered on the registers of Scotland during the year referred to; and when these numbers are compared with the estimated population, it appears that the proportion of births and of marriages was below the mean of the ten previous years, while the proportion of deaths was considerably above it. As compared with the year 1868, there were 2278 fewer births, 6403 more deaths, and 230 more marriages.

When these Reports were first commenced, with the view of aiding sanitary inquiries, and, if possible, of discovering the laws which regulate the proportion of births, deaths, and marriages, and discovering whether these events bore any relation to each other, the districts of Scotland were divided into two groups, viz.:—1st, TOWN DISTRICTS, embracing all the districts which contained towns with a population of 3000 and upwards; and 2d, RURAL DISTRICTS, embracing the remainder of Scotland. Year after year it was found that the closest possible relation existed between the births, deaths, and marriages in each of these groups of districts; for

---

TABLE I.—Population of Scotland, estimated to the middle of each year; Births, Deaths, and Marriages registered during each year from 1855 to 1869 inclusive; the Illegitimate Births, and the excess of Births over Deaths; also the Per-centage of Births, Deaths, and Marriages to the Population.

YEAR.	Population estimated to the Middle of each Year.	BIRTHS.		DEATHS.	MARRIAGES.	Excess of Births over Deaths.	Proportion to every 100 Persons living.		
		Total.	Illegit.				Births.	Deaths.	Marriages.

1863	3,101,345	109,341	10,948	71,481	22,234	37,860	3·525	2·305	0·716
1864	3,118,701	112,333	11,197	74,416	22,725	37,917	3·602	2·386	0·728
1865	3,136,057	113,070	11,262	70,891	23,611	42,179	3·605	2·260	0·753
1866	3,153,413	113,667	11,673	71,348	23,688	42,319	3·604	2·263	0·751
1867	3,170,769	114,044	11,148	69,068	22,613	44,976	3·593	2·177	0·710
1868	3,188,125	115,673	11,266	69,386	21,853	46,287	3·628	2·176	0·685
1869	3,205,481	113,395	11,023	75,789	22,083	37,606	3·537	2·364	0·689

while all were uniformly high in the Town, all were uniformly low in the Rural Districts. The year just closed was no exception to this rule, for in the 131 Town Districts, for every ten thousand persons there occurred the proportion of 388 births, 285 deaths, and 82 marriages; while in the Rural Districts the proportion was only 311 births, 175 deaths, and 51 marriages.

These facts show, in a general way, that life wore out more rapidly in the towns than in the country; but that to supply this greater waste of life, there were more marriages and more births, so that a perfect compensation was maintained.

The progress of knowledge, however, rendered it imperative to ascertain whether in all cases the proportion of births, deaths, and marriages kept pace with the density of the population, or rather with the size of the mass of human beings congregated together. To eliminate this important point, the districts of Scotland were divided into four groups:—1st, PRINCIPAL TOWNS, each of which have above 25,000 inhabitants; 2d, LARGE TOWNS, each of which have from 10,000 to 25,000 inhabitants; 3d, SMALL TOWNS, each of which have from 3000 to 10,000 inhabitants; and 4th, RURAL DISTRICTS, which embrace the remaining districts of Scotland. It then appeared that the proportion of births, deaths, and marriages in each of these four groups of districts rose with the density of the population,—that the proportion of all was highest in the Principal Towns, was next highest in the Large Towns, smaller in the Small Towns, but lowest of all in the Rural Districts.

Thus, in 1869, for every ten thousand persons in each of these groups, there occurred the proportion of 408 births, 325 deaths, and 94 marriages in the Principal Towns; 383 births, 276 deaths, and 75 marriages in the Large Towns; 351 births, 222 deaths, and 63 marriages in the Small Towns; but only the low proportion of 311 births, 175 deaths, and 51 marriages in the Rural Districts. (Tables V. and VI.)

A ten years' abstract of the births, deaths, and marriages in Scotland, viz. for the years 1856–1865, showed the same fact—that all these events occurred in each of the four groups of districts according to the density of the population. Thus, during these ten years, for every ten thousand persons in each of these four groups there occurred 387 births, 282 deaths, and 89 marriages in the Principal Towns; 380 births, 245 deaths, and 79 marriages in the Large Towns; 364 births, 212 deaths, and 69 marriages in the Small Towns; but only 314 births, 169 deaths, and 56 marriages in the Rural Districts.*

TABLE II.—Population of Scotland estimated to the middle of each year from the Excess of Births over Deaths, deducting Emigrants, and the Per-centage of Births, Deaths, and Marriages to that Population; also, the Annual Increase or Decrease of Births, Deaths, and Marriages.

YEAR.	Population estimated.	Yearly Increase of Population.	Emigrants.	Per-centage to Population.			Annual Increase or Decrease.		
				Births.	Deaths.	Marriages.	Births.	Deaths.	Marriages.
1861	3,066,633	35,694	8,974	3·484	2·032	0·681	+1380	—5829	— 329

1867	3,228,905	31,578	13,398	3·532	2·138	0·700	+ 375	—2280	—1070
1868	3,260,483	30,848	15,439	3·547	2·128	0·670	+1629	+ 318	— 765
1869	3,291,331	14,513	23,093	3·445	2·302	0·668	—2278	+6403	+ 230

* See *Thirteenth Detailed Annual Report of Registrar-General of Scotland*, p. xvi., Tables XIV. and XV.

These facts, then, seem to prove, that it is a law of nature that births, deaths, and marriages are equally influenced by density of population.

POPULATION.

In a small country like Scotland, where the known emigration to America and the Colonies, and the unknown emigration to England, Ireland,

etc., bears such a large proportion to the population, the estimated population towards the close of the decennial period since last Census was taken must be regarded as merely an approximation to the truth. To allow, however, of every one making what corrections he pleases on our estimate, and also to show how the proportions of births, deaths, and marriages would look when the population is differently estimated, there is appended another Table (Table II.), which shows what the number of the population would be during each year from 1861 to 1869 were the ascertained emigrants deducted from the excess of births over deaths. This Table, of course, makes no allowance for the large migration to England and Ireland, the continent of Europe or India, nor for the drafts to the army and navy. By our adopted mode of estimation, the population of Scotland at the middle of the year 1869 would amount to 3,205,481 persons. By the system adopted for Table II., it would amount to 3,291,333 persons. The actual population is probably something between these numbers.

BIRTHS.

113395 Births were registered in Scotland during the year 1869,—a number lower than that of the three previous years, but just what might have been expected from the diminution of marriages during the years 1867 and 1868. During the ten years 1859–1868, the mean annual birth-rate was in the proportion of 354 births in every ten thousand persons of the estimated population, or 3·54 per cent.; but during the year 1869 the proportion was 353 births in a like population, or 3·53 per cent.

Of these 113395 births, 976306 were registered in the Principal Towns, 277658 in the Large Towns, 535408 in the Small Towns, and 1425109 in the Rural Districts; giving for every thousand persons in each of these groups a proportion of 40 births in the Principal Towns, 38 births in the Large Towns, 35 births in the Small Towns, but only 31 births in the Rural Districts. (Tables V. and VI.) The influence of density of population on the births was therefore most strongly marked.

Even the Eight Divisions of Scotland showed, in a general way, the influence of density of population on the births. Thus, in the North-Western Division, with 23 persons to a square mile, there were 26 births to every thousand persons; in the Southern Division, with 66 persons to

a square mile, there were 30 births to every thousand persons; in the North-Eastern Division, with 96 persons to a square mile, there were 33 births to every thousand persons; in the East-Midland Division, with its 119 persons to a square mile, there were 34 births to every thousand persons; in the South-Eastern Division, with 219 persons to a square mile, there were 37 births to every thousand persons; while in the populous South-Western Division, with 441 persons to every square mile, there were 40 births to every thousand persons. (Table IV.)

Of the 113395 births, 102372 were legitimate and 11023 illegitimate,—indicating that 9·7 per cent. of the births were illegitimate. As usual, the proportion of illegitimate births was lower in the Town than in the Rural Districts. Thus, in the Principal Towns, 9·7 per cent. of the births were illegitimate, 7·5 per cent. in the Large Towns, 9·7 per cent. in the Small Towns, but 10·2 per cent. in the Rural Districts. It is singular that year after year the proportion of illegitimate births in the North-Eastern and Southern Divisions continues so very much above that of all the others; for while only 6·4 per cent. of the births were illegitimate in the North-Western, 7·3 per cent. in the Northern, and 8·3 per cent. in the

* The Large Towns have Populations from 10,000 to 25,000 persons. The Small Towns have Populations from 3,000 to 10,000 persons.

populous manufacturing, mining, and commercial South-Western Division, 14·6 per cent. of the births were illegitimate in the North-Eastern, and 15·4 per cent. in the Southern Divisions. It would be well that the probable causes of this very high rate of illegitimate births should be thoroughly inquired into.

As the approaching Census of the population will afford a favourable opportunity for investigating facts which throw light on various social problems, it may not be out of place to give a summary of the conclusions which have been already arrived at in these Reports, relative to various causes which were considered to influence the proportion of illegitimate births. The full details on which these conclusions were founded were published in the Detailed Annual Reports for the years 1855 to 1860 inclusive.

We have always maintained that illegitimacy in Scotland is different from illegitimacy on the Continent of Europe, inasmuch as it presents some features which seem to indicate that it has its origin in a different condition of the social relations. Thus, in all the kingdoms of the Continent of which we possess statistics, the illegitimate births are low in the Rural Districts, but rise to enormous dimensions in the Towns. Thus, in France, while only 4 per cent. of the births are illegitimate in the Rural Districts, 20 per cent. are illegitimate in the Towns, and from 27 to 32 per cent. in Paris. In Belgium, while only 5·7 per cent. of the births are illegitimate in the Rural Districts, 13·6 per cent. are illegitimate in the Towns, and 31·8 per cent. in Brussels. In Sweden, while only 7·8 per cent. of the births are illegitimate in the Rural Districts, 24·2 per cent. are illegitimate in the Towns, and 41·2 per cent. in Stockholm. In the Austrian Empire, in 1856, 13 per cent. of the births were illegitimate; but in Lower Austria, which includes Vienna, 47 per cent. of the births were illegitimate.

All this is opposed to the facts ascertained with regard to illegitimacy in Scotland; for a ten-yearly period shows that illegitimacy is less prevalent in the Towns than in the Rural Districts, seeing that only 9·0 per cent. of the births were illegitimate in the Towns, but 9·9 per cent. in the Rural Districts.

Again, on the Continent of Europe it has been invariably found that the proportion of males to females in the illegitimate births was much smaller than what occurred in the legitimate births. Thus, in Belgium, 105·5 males are born to every 100 females in the legitimate births, but only 102·5 males to every 100 females in the illegitimate births. In France, 105·5 males are

born to every 100 females in the legitimate births, but only 103·3 males to every 100 females in the illegitimate births. In Sweden, 106·0 males are born to every 100 females in the legitimate births, but only 103·5 males to every 100 females in the illegitimate births.

In Scotland this is reversed, the proportion of males in the illegitimate births exceeding that of the males in the legitimate births. Thus, take the thirteen years 1855 to 1867, 105·4 males were born to every 100 females in the legitimate births, but 106·7 males to every 100 females in the illegitimate births.

It was pointed out in our First Detailed Annual Report, and every subsequent year has confirmed the conclusion, that the illegitimate births were almost entirely confined to the lower, that is, to the labouring and working classes; and that the mothers of such children consisted chiefly of those employed about farms or in agricultural labour, of factory girls, of domestic servants, and those engaged in needlework and in shops. Private investigations showed, that in numerous instances the parents of these illegitimate children were true to each other, that the woman had borne several children to the same man, and that frequently these children were legitimated by the subsequent marriage of the parents. By this law, not only was the proportion of illegitimate persons in the population reduced, but possibly one of the strongest motives to infanticide was removed, inasmuch as the woman may have lived in the hope that the birth of the child would eventually be the means of inducing its father to marry her, and thus legitimate their offspring.

In so far as the registers could show such a fact, it was ascertained that in the great majority of cases the father of the illegitimate child belonged to the same rank as the mother; and this agrees with the observation of independent inquirers who have turned their attention to this subject.

In our Tenth Detailed Annual Report was given a Table showing the proportion of illegitimate births in every division and county of Scotland during the ten years 1855–1864. This Table, when compared with the proportion of those able to sign their names in writing in the marriage registers, confirms the conclusion drawn in former Reports, that there is no traceable connection between the ignorance, or want of education, among the people, and the proportion of illegitimacy Indeed, instead of the uneducated counties showing the highest proportion of illegitimate births, it was rather the reverse, seeing that the counties in which the proportion of illegitimate births was highest, were also those in which the highest proportion of men and of women were able to sign their names in writing in the marriage registers. Thus, in Ross and Cromarty, where only 3·9 per cent. of the births were illegitimate, only 60 per cent. of the men, and 45 per cent. of the women were able to sign their names in writing. In Inverness, where 7·6 per cent. of the births were illegitimate, only 71 per cent. of the men, and 53 per cent. of the women were able to sign their names in writing. In Lanark, where 7·4 per cent. of the births were illegitimate, only 84 per cent. of the men, and 69 per cent. of the women were able to sign their names in writing. On the other hand, in Aberdeen, where 15·3 per cent. of the births were illegitimate, 97 per cent. of the men, and 92 per cent. of the women were able to sign their names in writing. In Banff, where 15·5 per cent. of the births were illegitimate, 96 per cent. of the men, and 85 per cent. of the women signed their names. And in Dumfries, where 14·4 per cent. of the births were illegitimate, 97 per cent. of the men, and 95 per cent. of the women were able to adhibit their signatures in the registers.

These striking facts, then, seem to prove that the large proportion of illegitimacy in these highly educated counties is not a sin resulting from ignorance and debasement; for every one who is acquainted with these counties knows how intelligent are the natives, and that in other respects they are of a somewhat higher cast than the generality of the inhabitants of those counties where illegitimacy is not nearly so prevalent.

It is by no means easy to arrive at definite conclusions relative to the effect of proportion of marriages on illegitimacy, because another element comes into consideration, viz. the fact that the proportion of marriages is increased by density of population. Allowing for this, however, it appears that the counties and divisions in which illegitimacy occurs to the highest extent are those in which the proportion of marriages is low. Thus, if we contrast the North-Eastern and Southern Divisions of Scotland, in which above 14 per cent. of the births are usually illegitimate, with the South-Western and South-Eastern Divisions, in which only from 7 to 8 per cent. of the births are illegitimate, we shall find that the proportion of marriages in the North-Eastern and Southern Divisions was only 63 and 55 marriages respectively in every ten thousand persons, whereas in the South-Western and South-Eastern Divisions they were in the proportion of 80 and 81 marriages respectively in every ten thousand persons.

These facts seem to indicate, that in certain counties of Scotland some prudential or other checks to marriage must prevail; and it is believed that a considerable amount of the illegitimacy which these counties exhibit is the result of something approaching to concubinage, although in most instances where such a connection subsists the parties do not actually live together.

Much of the illegitimacy prevailing in certain counties was at one time attributed to the existence of what are called bothies, that is, houses apart from the farm-house, in which the male and female workers on the farm are separately lodged. These bothies only exist on the large farms, and if they had any influence in increasing the illegitimacy, the proportion of illegitimate births would have been found to be highest in those counties which had the largest arable farms. It is a known fact that the smaller the size of the farm the more it is worked with the assistance of young unmarried men and women, who are fed in the house, and sleep either in the house or in the stable-loft or offices. It is only on the large farms that married men are employed; so that, in many districts, so soon as a young man marries he loses his situation as a ploughman, and is forced to become a daily labourer, dependent on his daily work for his bread. This, of course, acts as a strong check on his openly marrying.

An official return was published in 1857, which, to a certain extent, enables us to trace the effect of the size of the farm on the proportion of illegitimate births in each county of Scotland; and it is instructive to note that, in a general way, the illegitimacy was found to be highest in those counties in which the smallest farms occurred. Thus, in Banff, the farms paying £20 and upwards of annual rent, only averaged 64 acres each, and 15·5 per cent. of the births were illegitimate annually. In Aberdeen, the farms paying £20 and upwards of rent, only averaged 66 acres in extent, and 15·3 per cent. of the births were annually illegitimate. In Dumfries, the average size of the farms paying £20 and upwards was 87 acres only, and the high proportion of 14·4 per cent. of the births was illegitimate annually. In Kirkcudbright, the average size of the farms paying £20 and upwards was 88 acres, and 13·4 per cent. of the births were

illegitimate. Contrast these with a few counties with large farms, where married men are employed, and bothies are, of course, more common. In the county of Edinburgh, the average size of farms paying £20 and upwards was 114 acres, and among the rural population only 8 per cent. of the births were illegitimate. In Fife, the average size of the farms above £20 of yearly rental was 110 acres, and only 7·6 per cent. of the births were illegitimate. In Haddington, the average size of the farms above £20 of yearly rental was 219 acres, and only 8·7 per cent. of the births were illegitimate.

Many years ago an attempt was made to show that 'the excess of female life is mainly at the root of that evil—illegitimacy.' Every known fact, however, both with regard to Scotland and other countries, contradicts such a theory. Thus, in the Northern Division of Scotland, which includes the counties of Shetland, Orkney, Caithness, and Sutherland, there were 121 females for every 100 males in 1861. Here, by that theory, the highest proportion of illegitimate births ought to occur; but, on the other hand, no division had such a low proportion, seeing that a ten years' average shows that only 5·4 per cent. of the births were illegitimate. The North-Western Division contains the next highest proportion of females to males, viz. 114 females to every 100 males; and it contained the second lowest proportion of illegitimate births, viz. 5·7 per cent. of the births.

On the other hand, the two divisions which contain the average Scottish proportion of females to males,—viz. the North-Eastern and Southern Divisions,—viz. 111 females to every 100 males, are those which yielded the highest proportion of illegitimate births, viz. 14·7 and 13·4 per cent. of the births as illegitimate.

But the whole statistics of the Continent of Europe as well as of Scotland prove the same fact—viz. that excess of female life has no effect whatever in increasing illegitimacy.

Thus, Scotland has 111 females to every 100 males in her population, and a ten years' average shows that 9·1 per cent. of the births are illegitimate.

Denmark has a nearer equality of the sexes than almost any other kingdom, viz. 100·8 females to every 100 males, and 9·3 per cent. of her births are illegitimate.

In Hanover, the sexes are still more nearly equal, viz. 100·3 females to every 100 males, yet 10·1 per cent. of her births are illegitimate.

Austria has only 102·9 females to every 100 males, yet 13 per cent. of her births are illegitimate.

Bavaria has only 103 females to every 100 males, yet 21·9 per cent. of her births are illegitimate.

Saxony has only 104·5 females to every 100 males, yet 14·8 per cent. of her births are illegitimate.

Sweden, which makes the nearest approach of the continental kingdoms to Scotland in the proportion of her sexes, has 106·3 females to every 100 males, and 9·3 per cent. of her births are illegitimate.

Every reliable fact, therefore, fails to establish the theory which ascribes the prevalence of illegitimacy to the excess of female life. Every one knows that the female is far more virtuous and continent than the male; and the converse of the proposition in question would be much nearer the truth.

Many are disposed, not unnaturally, to attach great weight to the insufficiency of house accommodation as one mode of accounting for the prevalence of illegitimacy. It is argued that, where there is insufficient

accommodation for a family, and a necessary impossibility of observing the common decencies of social life, no other result, in regard to the females especially, could be looked for than a loss of that modesty and innate delicacy which are the best safeguards in afterlife. That overcrowding may have a pernicious effect, is what no one probably will be prepared to deny; but a comparison of the returns as to house accommodation with those of illegitimacy in the different divisions and counties of Scotland, seems to show that other causes, as yet unknown, are at work in producing effects so greatly to be deplored.

If the proportion of illegitimate births depended on the amount of house accommodation, it would be found that, in every county or division of Scotland, the proportion of illegitimate births would bear some proportion to that of the number of families living in houses of one room. As we have a perfect return of the house accommodation of all classes in Scotland, we have the data whereby we may estimate the effect which such a state of matters exercises on the point now under consideration; and that return, invaluable in many respects, is in none more remarkable than in proving that the effect of deficient house accommodation in increasing the proportion of illegitimate births is less than is generally supposed.

Thus, a ten years' summary of the proportion of illegitimate births in the divisions and counties of Scotland, shows that by far the highest proportion of illegitimate births occurs in the North-Eastern and Southern Divisions; while the smallest proportion occurs in the Northern and North-Western Divisions, the other four divisions occupying an intermediate place. In the North-Eastern Division, which includes the counties of Nairn, Elgin, Banff, Aberdeen, and Kincardine, only 25·2 per cent. of the families lived in houses of one room, yet 14·7 per cent. of the births were illegitimate; that is to say, that the division which had the very smallest proportion of its inhabitants living in houses of one room, was also the division which year after year yielded the very highest proportion of illegitimate births.

Contrast with this the Northern Division, which includes the counties of Shetland, Orkney, Sutherland, and Caithness. There 36·7 per cent. (being a full third more than in the North-Eastern Division) of the families lived in houses of one room, yet only 5·4 per cent. of the births were illegitimate.

Contrast it even with that division which is the far worst as to house accommodation in all Scotland. In the South-Western Division, which includes the counties of Renfrew, Ayr, and Lanark, no fewer than 40·6 per cent. of the families live in houses of one room; yet, instead of this increasing the proportion of illegitimate births above what they are in the North-Eastern Division, they were not half so numerous, seeing that only 7·5 per cent. of the births were illegitimate in the South-Western Division.

Contrast with each other even the adjoining South-Western and Southern Divisions. The former had 37·1 per cent. of its families living in houses of one room, yet only 8·4 per cent. of its births were illegitimate; the latter had only 34·2 per cent. of its families living in houses of one room, yet 13·4 per cent. of its births were illegitimate.

The influence of the social evil on illegitimacy, either in the way of increasing or diminishing it, we have been unable to trace in Scotland; though in some of our seaport towns, as Leith and Greenock, it certainly seems to have the effect of diminishing the proportion of illegitimate births.

It is thus seen that we are nearly as far as ever from the solution of

the problem as to the causes of illegitimacy, and as to the reason why the proportion in some counties should always be double what it is in others. The non-influence of all the above examined causes seems to point out that the special cause must be sought for in the habits of the people, their greater or lesser addiction to night courtships, to the want of moral training, and to the incontinence of youth, which in some counties finds its legitimate channel in marriage, though it may be in improvident marriage, while in others the prudential check operates so strongly that it leads to that form of non-resident concubinage which results in illegitimacy.

But while the causes of illegitimacy seem at present to be obscure, the extent of the illicit intercourse which leads to the birth of illegitimate children is quite capable of being pretty accurately calculated. Thus, if we take the ten years 1856–1865, and compare the mean annual number of legitimate and illegitimate births with the number of the married and unmarried women at the childbearing ages, viz., from 15 to 45 years of age, we arrive at the following conclusions. During that period the mean number of married women, between the ages of 15 and 45 years, was 305524, and they produced annually 97021 legitimate children, being at the rate of one child for every 3·15 married women at the childbearing ages, or 100 children for every 315 wives. During the same period there were annually born 10004 illegitimate children; and as we may safely assume that the unmarried women who bore these children produced them in the same ratio as the married women, this would show that 31512 unmarried women in Scotland, between the ages of 15 and 45 years, annually put themselves in the way of being mothers, being one in every 13 of the unmarried women between the ages of 15 and 45.

Of the 113395 children born during the year, 58396 were boys and 54999 girls; showing that the proportion of the sexes at birth was 106·1 boys to every 100 girls—a higher proportion of boys than usual, the mean Scottish rate being 105·5 boys to every 100 girls.

The greatest daily number of births occurred during the months of March, April, May, and June, when they averaged from 316 to 333 daily. The lowest number of births occurred during the months of August and September, when they respectively numbered 293 and 291 births daily. (Table XV.)

DEATHS.

78789 Deaths were registered in Scotland during the year 1869, being 6403 more deaths than occurred during the previous year, and in the high proportion of 236 deaths in every ten thousand persons, or 2·36 per cent. The mean death-rate of the ten previous years was only 219 deaths in every ten thousand persons, or 2·19 per cent., so that the mortality of the year was high above its average.

The mean English death-rate is higher than that of Scotland, being, on a ten years' average, 224 deaths annually in every ten thousand persons, or 2·24 per cent. But during the year 1869, though the death-rate was also above its average, it was not nearly to the same extent as in Scotland, seeing that it was in the proportion of 226 deaths in every ten thousand persons, or 2·26 per cent. Agencies injurious to health were therefore more prevalent in Scotland than in England during 1869.

The Town and Rural Districts of Scotland showed the usual striking

difference in the proportion of deaths. Thus, of the 75789 deaths, 50848 occurred in the Town and 24941 in the Rural Districts, giving a proportion of 285 deaths in every ten thousand persons in the Town, but only 175 deaths in a like population in the Rural Districts. (Tables V. VI. and VIII.)

The influence of density of population on the mortality was, however, most strikingly exhibited when Scotland was divided into four groups of districts according to the size of the towns in each. It then appeared that, for every ten thousand persons in each of these groups, 325 deaths occurred during the year in the Principal Towns, 276 deaths in the Large Towns, 222 deaths in the Small Towns, but only 175 deaths in the Rural Districts.

If these proportions be compared with the mean annual death-rate in the same four groups during the ten years 1856–1865, it will be seen that the increase extended over all the groups. This of itself proves that the determining cause of the increased death-rate was some general influence which acted over all Scotland, though most severely felt in those towns where the population was most crowded, and their general health enfeebled, so that they had less power to resist the deleterious agency. Thus, during the ten years 1856–1865, in every ten thousand persons in each group, there occurred the annual proportion of 282 deaths in the Principal Towns, 245 deaths in the Large Towns, 212 deaths in the Small Towns, and 169 deaths in the Rural Districts.

These are almost the exact proportions in which the deaths occurred in each of these four groups of districts in 1868 ; and as it is quite impossible to conceive that the sanitary condition of a whole country, and of all its Town and Rural Districts, could have so suddenly deteriorated in 1869 as to give rise to the great increase of mortality during that year, it is only reasonable to ascribe the increase to unfavourable atmospheric conditions, over which man has no control. The very circumstance of the increased mortality affecting the Rural and Small Town Districts as well as the Principal and Large Towns, infallibly leads to this conclusion, even though it is granted that the mortality will in general be proportionally highest where the health of the people is most deteriorated by overcrowding and breathing impure air.

			YEAR	1·61	1·70	1·62	1·74	1·83	1·84	1·70	1·78	1·62	1·63	1·70	1·75

This subject will be examined more closely when noticing the death-rate prevailing in the Eight Principal Towns of Scotland, and the diseases which were the chief agents in giving rise to the high mortality.

MARRIAGES.

22083 Marriages were registered in Scotland during the year 1869, being 230 more than during the previous year, but 535 fewer than during 1867, and 1605 fewer than during the year 1866. Marriages have therefore been diminishing in number since 1866, and this fact is now being seen in the diminution of the birth-rate. The mean annual marriage-rate during the ten previous years was 70 marriages in every ten thousand persons, but during the year 1869 it was at the rate of 69 marriages to the same population.

As usual, the proportion of marriages contracted in the Town Districts was very much above those in the Rural Districts. Thus, of the 22083 marriages, 14748 were contracted in the Town, and 7335 in the Rural Districts; indicating that, in every ten thousand persons in each of these, 82 marriages occurred in the Town, but only 51 marriages in the Rural Districts.

Like the births and the deaths, however, the proportion of marriages is influenced by the density of the population. Thus, when Scotland was divided into four groups, according to the size of the towns in each, it was found that, for every ten thousand persons in each group, 94 marriages were contracted in the Principal Towns, 75 marriages in the Large Towns, 63 marriages in the Small Towns, but only 51 marriages in the Rural Districts.

EIGHT PRINCIPAL TOWNS OF SCOTLAND.

It is of great importance that the public should get as early information as possible of the birth, death, and marriage rates of those masses of the population which are collected in our Principal Towns. Weekly Reports are therefore issued every Tuesday, giving the number of births, deaths, and marriages registered during the previous week in Glasgow, Edinburgh, Dundee, Aberdeen, Paisley, Greenock, Leith, and Perth; together with the highest, lowest, and mean temperatures at each town, and the respective fall of rain.

Monthly Reports applicable to the Eight Towns are also published, and these are much more valuable, inasmuch as they not only give the mere number of the births, deaths, and marriages, but also the particulars as to the ages of the persons who have died, and the diseases which proved fatal. The public and the authorities are thus kept informed as to the outbreak or progress of every disease affecting the people, within as short a period after

the close of each month as is compatible with the due preparation of the Tables.

In the remainder of this Report there will therefore be given a summary of the births, deaths, and marriages in each of these Eight Towns during 1869. As these towns are well scattered over the country, and have a conjoint population of not much under a third of the population of Scotland, the returns from them enable us to obtain a very fair idea of the kind of diseases which are prevalent, and how far the mortality from these is influenced by local or general causes.

BIRTHS IN THE EIGHT TOWNS.

39515 Births were registered in the Eight Principal Towns of Scotland during the year 1869, being at the high rate of 408 births in every ten thousand persons of the population, or 4·08 per cent. This is a lower proportion than occurred during any of the four previous years, but the diminution is satisfactorily accounted for by the diminution in the number of marriages during the years 1867 and 1868. (Table IX.)

The birth-rate, however, varied much in the several towns, having been highest in Greenock and lowest in Perth. Thus, for every thousand in each of the towns, there occurred in the proportion of 30·5 births in Perth, 36·4 in Paisley, 38·0 in Edinburgh, 41·0 in Glasgow, 41·1 in Aberdeen, 43·5 in Dundee, 45·0 in Leith, but the extremely high proportion of 49·2 births in Greenock. (Table X.)

It is necessary to remark that the proportions of births, deaths, and marriages may be somewhat overrated for Greenock, seeing that there is good reason to believe that the population there during the two past years has been increasing in a more rapid ratio than is allowed for. The strikes among the shipbuilders on the Thames, and elsewhere in England, have caused almost the total transfer of the iron shipbuilding trade to the banks of the Clyde, and the consequent influx of population to Greenock and the neighbouring towns has been without a precedent. The deficient house accommodation, however, and the difficulty of procuring new sites, limit the increase of the population in the town of Greenock itself, so that it may, after all, turn out that the estimated population is not far from the truth.

Of the 39508 births in the Eight Towns, 35667 were legitimate and 3841 illegitimate, indicating that 9·7 per cent. of the births were illegiti-

1859	866,698	33,018	3·80	22,345	2·57	7541	0·87
1860	876,683	32,945	3·75	26,028	2·95	7660	0·87
1861	887,450	34,331	3·79	23,130	2·60	7733	0·87
1862	897,432	34,443	3·83	24,965	2·78	7694	0·85
1863	907,414	35,895	3·95	27,030	2·97	8593	0·94
1864	917,396	37,072	4·05	28,828	3·14	8884	0·96
1865	927,378	38,075	4·10	28,499	3·07	9320	1·00
1866	937,360	38,552	4·11	27,448	2·92	9450	1·00
1867	947,342	39,012	4·11	26,511	2·79	8867	0·93
1868	957,324	39,513	4·12	28,031	2·92	8606	0·90
1869	967,306	39,515	4·08	31,450	3·25	9161	0 90

mate. The proportion of illegitimate births, however, varied greatly in the several towns. (Table X.) Thus, in Greenock, only 5·4 per cent. of the births were illegitimate; in Leith, 6·5 per cent.; in Paisley, 9·4; in Glasgow, 9·7; in Perth, 9·8; in Edinburgh, 10·1; in Dundee, 11·4; and in Aberdeen, 11·6 per cent.

Of the children born during the year, 20210 were males and 19298 females; indicating that 104·7 males were born for every 100 females, being a considerably lower proportion of boys than over all Scotland, where the proportion was 106·1 boys to every 100 girls. It has been pointed out in former Reports, that this indicates a lower tone of vitality than in the other districts of Scotland, and thus confirms the conclusions drawn from other circumstances as to the hurtful effects of density of population (or a residence in towns) on human life.

DEATHS IN THE EIGHT TOWNS.

31450 Deaths were registered in the Eight Towns during the year 1869, being in the very high proportion of 325 deaths in every ten thousand persons,—that is, 32·5 in every thousand, or 3·25 per cent. The average annual death-rate of the fourteen previous years was 282 deaths in every ten thousand persons,—that is, 28·2 in every thousand, or 2·82 per cent. The death-rate has therefore been excessive during the year, and the very highest which has ever been noticed since the Registration Act came into operation in 1855. During the previous year, that of 1868, the mortality was only slightly above the average; but as compared with it, the year 1869 has yielded an excess of 4938 deaths in the Eight Towns, being an increase to the extent of 18·6 per cent. in one year.

By comparing the death-rate in the several towns during each of the past eleven years (Table XI.), it will be seen that the mortality does not rise and fall in each simultaneously; and in former returns it has been pointed out that it almost always happens that different epidemic diseases take the lead in each town. During the past year, when the general mortality in the Eight Towns rose so high above the average, Aberdeen

TABLE X.—Births, Deaths, and Marriages, and their Proportion to the estimated Population, during the Year 1869, in each of the Eight Principal Towns of Scotland; also, the Illegitimate Births, and their Proportion to the Total Births.

Towns.	Population estimated to the middle of 1869.	BIRTHS.		ILLEGIT. BIRTHS		DEATHS.		MARRIAGES.	
		Number.	Per Cent. to Pop.	Number.	Per Cent. to Total Births.	Number.	Per Cent. to Pop.	Number.	Per Cent. to Pop.
Glasgow	450,283	18490	4·10	1808	9·7	15640	3·47	4221	0·93
Edinburgh	177,696	6755	3·80	681	10·1	5403	3·04	1753	0·98
Dundee	101,259	4411	4·35	503	11·4	3562	3·51	919	0·90
Aberdeen	75,484	3102	4·11	362	11·6	1784	2·36	682	0·90
Paisley	47,427	1737	3·64	164	9·4	1449	3·05	408	0·86
Greenock	49,215	2424	4·92	133	5·4	1749	3·55	532	1·08
Leith	39,172	1763	4·50	115	6·5	1169	2·95	427	1·09
Perth	27,265	833	3·05	82	9·8	694	2·54	219	0·80

exhibited the striking exception of having its death-rate considerably below its own average of the ten previous years; for whereas its mean annual mortality was 26·3 deaths in every thousand persons during these ten years, only 23·6 deaths occurred in a like population in 1869. In all the other towns the death-rate during 1869 exceeded the average of former years.

As usual, the death-rates in the different towns differed greatly from each other, having been lowest in Aberdeen and highest in Greenock. Thus, for every thousand persons in each town, there occurred 23·6 deaths in Aberdeen, 25·4 deaths in Perth, 29·5 deaths in Leith, 30·4 deaths in Edinburgh, 30·5 deaths in Paisley, 34·7 deaths in Glasgow, 35·1 deaths in Dundee, and 35·5 deaths in Greenock.

Of the 31450 persons who died in the Eight Towns during the year, 14070, being 44·74 per cent., were under 5 years of age; 3425, being 10·89 per cent., were between 5 and 20 years of age; 8940, being 28·43 per cent., were between 20 and 60 years of age; while 5014, being 15·94 per cent., were above 60 years of age. (Table XIX.)

These proportions closely correspond to the mean average of deaths at these various ages during a ten-yearly period. Thus, during the ten years 1856–1865, 45·93 per cent. of the persons who died were under 5 years of age, 10·25 per cent. were between 5 and 20 years of age, 27·78 per cent. were between 20 and 60 years of age, while 16·04 per cent. were above 60 years of age. (Table XXI.)

In our eagerness to calculate the mean probabilities of life, and the mean age at death, we are very apt to overlook the startling fact, that in our towns 46 per cent. of the deaths which occur year by year are composed of children under 5 years of age, who know not good from evil.

To arrive, however, at an accurate knowledge of the proportional mortality of children in each town, we must compare the deaths with the living at the same ages. Table XII. shows the numbers living in each town under 5 years of age, the deaths under 5 years, and the per-

Table XI.—Per-centage of Deaths in each of the Eight Principal Towns of Scotland during each of the Years 1859–1869.

Table XII.—Deaths of Children under Five Years of Age in each of the Eight Principal Towns of Scotland, during the Year 1869.

Towns.	Number of Children under Five Years of Age, in 1869.	Deaths under Five Years of Age.	Per-cent. of Deaths to Population under Five Years.	Towns.	Number of Children under Five Years of Age, in 1869.	Deaths under Five Years of Age.	Per-cent. of Deaths to Population under Five Years.
Glasgow	62,507	7539	12·0	Paisley	6767	618	9·1
Edinburgh	20,738	2156	10·3	Greenock	7137	831	11·6
Dundee	13,353	1567	11·7	Leith	5441	599	11·0
Aberdeen	9401	514	5·4	Perth	3406	247	7·2

centage of deaths to the living. By that Table it appears that Aberdeen showed the smallest proportional mortality among infants, Glasgow the highest. Thus, for every thousand living children under 5 years of age, there died during the year 54 in Aberdeen, 72 in Perth, 91 in Paisley, 103 in Edinburgh, 110 in Leith, 116 in Greenock, 117 in Dundee, and 120 in Glasgow.

The Zymotic (epidemic and contagious) class of diseases proved fatal to 8278 persons in the Eight Towns, and thus constituted 26·6 per cent. of the mortality. This is a high proportion, but yet very little more than the average zymotic mortality of the whole town districts of Scotland during the ten years 1855–1864. During that period, 26·2 per cent. of the deaths were caused by the zymotic class of diseases. So that high though the mortality has been during 1869 above that of previous years, that single fact proves that the zymotic diseases had only increased in an equal ratio with all other diseases,—in fact, that the causes which produced the high mortality were general causes which affected nearly all classes of diseases alike.

The relative mortality, however, from the zymotic class of diseases varied very much in the several towns, depending greatly on which was the leading epidemic, and whether its type was a severe or a mild one. Thus, only 16·2 per cent. of the deaths were caused by the zymotic class of diseases in Aberdeen, 21·8 per cent. in Edinburgh, 27 per cent. in Paisley, 27·7 per cent. in Glasgow, 28·5 per cent. in Leith, 30·2 per cent. in Greenock, 31 per cent. in Dundee, and 31·4 per cent. in Perth.

In order to point out that it is not the same epidemic which takes the lead in each town, but that the epidemic constitution, whatever it be, is under subjection to local causes, of which as yet we know nothing, we may shortly mention the epidemic diseases which prevailed and took the lead in each town.

In Glasgow, the most fatal of the epidemics was Fever, which caused 1221 deaths, being 7·89 per cent. of the deaths; after that Scarlatina, 895 deaths; then Hooping-cough, 719 deaths; and Measles, 654 deaths;—the mortality of all these being above the usual proportion.

In Edinburgh, Hooping-cough was by far the most fatal of the epidemics, causing 315 deaths, and thus constituting 5·86 per cent. of the mortality; after this came Scarlet Fever, 191 deaths; Fever, 181 deaths; and Diarrhœa, 149 deaths;—the mortality of all these being normal.

In Dundee, Scarlet Fever raged like a plague, causing 669 deaths, or the enormous proportion of 19 per cent. of the deaths; after this came Fever, which caused 140 deaths, constituting 3·97 per cent. of the deaths, or very little more than the normal mortality from that disease. All the other epidemic diseases had a mortality greatly below their average, and only two deaths from Measles occurred during the year.

The fact of one epidemic disease of children, when it rages as a virulent epidemic, taking the place of the others, and throwing them into abeyance, has been frequently remarked in Scotland, and the above is one of the most striking instances which has occurred since the Registration Act came into operation.

In Aberdeen, Fever was by far the most fatal of the epidemics, causing 113 deaths, or 6·40 per cent. of the mortality, being considerably above the town proportion of Fever deaths. Diarrhœa was the next most fatal of the epidemics; but it only caused 44 deaths, or 2·49 per cent. of the mortality. The deaths from Measles, Scarlatina, Diphtheria, and Hooping-cough were very few, and very far below their usual average.

In Paisley, Hooping-cough was the most fatal of the epidemics, causing 128 deaths, or 8·98 per cent. of the mortality; after this came Scarlatina, 86 deaths, being 6·03 per cent. of the mortality, or a third above the normal town average; then followed Fever, 75 deaths, being 5·26 per cent. of the mortality—slightly above the average. The mortality of all the other epidemic diseases was greatly under the average.

In Greenock, Scarlet Fever was the most fatal of the epidemics, causing 150 deaths, or 8·99 per cent. of the mortality—just twice the usual per-centage of that disease. Next followed Fever, causing 101 deaths, or 6·05 per cent. of the mortality; then Diarrhœa, causing 71 deaths, or 4·25 per cent. of the mortality. The mortality of Hooping-cough and Measles was slightly below the average; but Small-pox prevailed to an unusual extent, causing 37 deaths, or 2·22 per cent. of the mortality.

In Leith, Scarlet Fever was by far the most fatal of the epidemics, causing 94 deaths, or 8·09 per cent. of the mortality. Measles caused 62 deaths, being 5·34 per. cent. of the mortality; and Hooping-cough 57 deaths, or 4·91 per cent. of the deaths. All the usual epidemics of children were therefore unusually prevalent in Leith, but the other epidemics were not more fatal than usual.

In Perth, as in Dundee, Scarlatina raged like a pestilence, cutting off 157 persons, and thus constituting the enormously high proportion of 22·82 per cent. of the deaths. To make up for this, the other epidemics of children were in abeyance, so that there were no deaths from Small-pox or Measles,

---

only one from Diphtheria, seven from Hooping-cough, and twelve from Croup. Even Diarrhœa and Fever were far less prevalent than usual.

It is only of late years that British physicians have recognised the different forms of Continued Fever, so as to be able to distinguish them; and when they were suddenly startled many years ago with an outbreak of Fever, the leading type of which was the Relapsing, they originated the theory that Fevers were changing their type. For at least a century and a half epidemics of Fever have prevailed over the country, which were sometimes characterized by the majority of the cases being Typhus, at other times Enteric, and at other times Relapsing Fever; but in numerous instances it occurred that all the three forms co-existed in the same epidemic. During 1869, of the 1221 deaths from Fever in the Eight Towns, 948 were from Typhus, 221 from Enteric, 12 from Relapsing, 9 from Simple Continued, and 31 from Infantile Fever, which is a mere variety of Enteric, if indeed it be a variety. It is thus seen that all the various types of Fever are to be met with among the population, and the unknown atmospheric agencies which lead to the outbreak of Fever may cause any one of these at any time to take the lead. In most of the Towns, Typhus was the prevalent form of Fever during 1869; but in Leith, nearly twice as many deaths occurred from Enteric as from Typhus Fever.

Of Diseases of Uncertain Seat in the Eight Towns, Cancer caused 434 deaths, and undefined Dropsy 371. It is somewhat remarkable, that year after year, Edinburgh and Aberdeen seem to furnish twice the proportion of

---

deaths by Cancer that other towns do. It would be interesting to inquire into the probable cause of this.

The Tubercular Class of Diseases caused 5117 deaths in the Eight Towns, and thus constituted 16·47 per cent. of the deaths, or caused 53 deaths in every ten thousand persons of the population. This, as compared with the deaths, is a lower proportion than usual; but as compared with the population, it is a higher proportion than usual. This fact shows that though the actual number of deaths from this class of diseases was higher than usual, yet the increase was not proportional to the increase of the deaths from all other causes. In other words, the above facts showed that the cause (whatever it was—call it atmospheric) which gave rise to the increased mortality in 1869, though it also increased the deaths from the tubercular affections, did not increase them to the same extent as it increased the deaths from other causes. This is, in fact, only giving an instance of what has been again and again observed with regard to the diseases classed under this head, that their mortality from year to year is more steady than that of most other diseases, and that they are less liable to those extreme fluctuations to which the zymotic diseases and the inflammatory affections of the respiratory organs are liable.

Of the diseases belonging to this class, Consumption or Phthisis was the most fatal, causing 3572 deaths in the Eight Towns, or 11·49 per cent. of the mortality. The proportion of deaths from Consumption in the several towns was very different. Thus, only 7·15 per cent. of the deaths were from Consumption in Leith, 8·86 per cent. of the deaths in Perth, 10·17 per cent. in Edinburgh, 11·37 in Paisley, 11·71 in Glasgow, 12·39 in Dundee, 13·49 in Greenock, and 13·94 in Aberdeen. The very circumstance of Aberdeen showing such a high proportion of deaths from Consumption, as compared with the total deaths, is a good example of the truth of the above remarks relative to the greater steadiness from year to year of the deaths from the tubercular diseases. In Aberdeen the general mortality was below the average of former years, and the deaths from Consumption in 1869 were also below the mean, but not so much as the other diseases. Therefore, though the actual deaths from Consumption were 17 fewer in number than during the previous year, the relative proportion of deaths from that disease was 13·94 per cent. of the deaths in 1869, but only 12·64 per cent. in 1868.

When the deaths from Consumption in the Eight Towns are compared with the population, Leith would appear to be the town least liable to that complaint, Greenock the most liable. Thus, for every ten thousand persons in each town, there died from Consumption during the year, 21 in Leith, 22 in Perth, 30 in Edinburgh, 32 in Aberdeen, 34 in Paisley, 40 in Glasgow, 43 in Dundee, and 48 in Greenock.

Of the other tubercular diseases, Hydrocephalus caused 944 deaths, Tabes Mesenterica 390, and Scrofula 211.

Diseases of the Brain and Nervous System caused 2450 deaths in the Eight Towns, and thus constituted 7·88 per cent. of the mortality, or caused 26 deaths during the year in every ten thousand persons. The mortality from the brain diseases was very different in the several towns. Thus they constituted 6·41 per cent. of the deaths in Greenock, 6·93 per cent. of the deaths in Glasgow, 6·96 per cent. in Dundee, 8·01 per cent. in Leith, 9·01 per cent. in Perth, 9·40 per cent. in Paisley, 10·12 per cent. in Edinburgh, and 10·88 per cent. of the deaths in Aberdeen. As compared with the population, for every ten thousand persons in each town, there died from

brain disease 22·0 in Perth, 22·8 in Greenock, 23·9 in Leith, 24·1 in Glasgow, 24·5 in Dundee, 25·7 in Aberdeen, 28·7 in Paisley, and 30·7 in Edinburgh.

Diseases of the Heart and Organs of the Circulation caused 1209 deaths, thus constituting 3·89 per cent. of the deaths, or 12·6 deaths in every ten thousand persons. The proportion of deaths from Heart Disease was highest in Edinburgh and Perth, lowest in Paisley and Glasgow. Thus, only 2·38 per cent. of the deaths were caused by Heart Disease in Paisley, 2·83 per cent. in Glasgow, 3·83 per cent. in Dundee, 4·05 per cent. in Leith, 4·92 per cent. in Greenock, 5·50 per cent. in Aberdeen, 6·16 per cent. in Edinburgh, and 6·39 per cent. in Perth. As compared with the population, the mortality from Heart Diseases was lowest in Paisley and highest in Edinburgh.

Inflammatory Affections of the Respiratory Organs caused 6198 deaths, being an increase of 1587 deaths, or 34·4 per cent., from this cause alone over those of the previous year. They thus constituted the very high proportion of 19·95 per cent. of the deaths, or caused 64·8 deaths in every ten thousand persons. The average town proportion is only 15·05 per cent. of the deaths, or 40·7 deaths in every ten thousand persons, so that it is at once apparent how very great has been the increase on this class of diseases during the past year. It is acknowledged by all that this class of diseases is almost entirely under the influence of atmospheric agencies. They regularly diminish in prevalence with the advance of mild weather, and as regularly increase with the decrease of temperature, or with the blowing of cold northerly or easterly winds. As nearly half of the increased mortality of the year was therefore caused by these diseases—that is, was caused by atmospheric influences—and as these same atmospheric agencies have again and again been proved to increase the mortality from all diseases, we have a perfectly satisfactory reason for the increased mortality which prevailed in our towns during 1869, without requiring to assume that their sanitary condition had suddenly deteriorated to the extent of 18·6 per cent.

The deaths from inflammatory affections of the respiratory organs was lowest in Perth, highest in Glasgow. Thus, for every ten thousand persons in each town, there occurred 29 deaths in Perth, 39 in Paisley and in Aberdeen, 52 in Greenock and in Leith, 58 in Edinburgh and in Dundee, and 79 in Glasgow. Or, if compared with the total deaths, 11·62 per cent. of the deaths were caused by that class of diseases in Perth, 12·91 per cent. in Paisley, 14·64 per cent. in Greenock, 16·72 per cent. in Aberdeen, 16·76 per cent. in Dundee, 17·57 per cent. in Leith, 19·37 per cent. in Edinburgh, and 23·01 per cent. in Glasgow. The mortality from that class of diseases was therefore excessive in Glasgow, and very high in Edinburgh, Dundee, Leith, and Greenock.

Of the various diseases belonging to this class, Bronchitis caused 4381 deaths in the Eight Towns, Pneumonia 1285, undefined Disease of Lungs 249, Asthma 197, Pleurisy 79, and Laryngitis 57.

Diseases of the Organs of Digestion caused 2003 deaths in the Eight Towns, thus constituting 6·44 per cent. of the mortality, or 20·8 deaths in every ten thousand of the population.

Of the other classes of disease, Diseases of the Urinary Organs caused 367 deaths; Childbirth and Diseases of the Generative Organs, 272 deaths; Rheumatism and Diseases of Joints and Bones, 162 deaths; Skin Diseases, 32 deaths; Malformations, 56 deaths; Debility and Premature Birth, 1428 deaths; Old Age, 1263 deaths; Sudden, 106 deaths.

Including the cases of Metria, or Childbed Fever, 265 mothers died in

giving birth to 39515 children, showing that one mother died for every 149 children born alive.

946 deaths were ascribed to violent causes in the Eight Towns, thus constituting 3·04 per cent. of the deaths, or 9·9 deaths in every ten thousand persons. It is a very remarkable fact, explain it how we will, that in general the deaths from accident rise and fall with the deaths from disease. Thus, during 1869, the increase on the total deaths over the previous year was 18·6 per cent.; and it cannot fail to strike every one with surprise, to find that the increase on the accidental or violent deaths was to the extent of 15·6 per cent.

In proportion to the population, Greenock and Leith, and then Glasgow, had the highest mortality from violent deaths; Paisley and Perth the lowest. 371 deaths resulted from fractures and contusions, 146 from drowning, 85 from burns and scalds, 63 from suffocation, 22 from hanging, 78 from want of breast milk, 54 from intemperance, 4 from privation of food, 3 from exposure to cold, 13 from poison, 5 from poisoned wounds, 7 from gunshot wounds, 15 from cuts and stabs, and 70 from other violent causes not included in the above.

Of the 946 violent deaths, 45 were suicides, and one a murder.

MARRIAGES IN THE EIGHT TOWNS.

9161 Marriages were registered in the Eight Towns during 1869, being 555 more marriages than during the previous year, or an increase by 6·4 per cent. This indicates the high marriage-rate of 94 marriages in every ten thousand persons, that of the previous year being only 90 marriages in a like population.

The proportion of marriages in the several towns was lowest in Perth, and highest in Leith. Thus, for every ten thousand persons in each town, there occurred 80 marriages in Perth, 86 in Paisley, 90 in Dundee and Aberdeen, 93 in Glasgow, 98 in Edinburgh, 108 in Greenock, and 109 in Leith.

WEATHER AND ITS INFLUENCE ON THE MORTALITY.

It may now be regarded as an established fact, that in Scotland the weather is the agent which exerts the most powerful influence on the mor-

tality. During few seasons does the temperature of the warmer months rise so high as to induce an increased mortality. Hence, in Scotland, the more genial months are those which are most healthy. In all countries, however, where the mean temperature of the summer or autumnal months rises above 60°, the greatest mortality occurs during these warm months; and hence it happens that, even in Scotland, when the temperature rises higher than usual, an increase in the deaths is observed, and that increase is caused by the same class of diseases (viz. bowel-complaints) which induce the high mortality during the hot months of warmer regions.

In Scotland it is the cold which is the chief agent in increasing and regulating the deaths; but the cold exerts its deleterious action under two forms—1st, through mere lowness of temperature; and, 2d, through the agency of cold northerly or easterly winds. As a general rule, the coldest months are also the most fatal; but if, with a low temperature, the keen, arid northerly or easterly winds blow with anything like severity, the mortality becomes as high as if a pestilence were raging.

The influence of these combined deleterious atmospheric agencies in increasing the mortality was strikingly illustrated during 1869, which showed itself, in more ways than one, to be a year characterized by its exceptional meteorological phenomena.

Thus, taking a ten years' average, January and February are the coldest months, averaging respectively 37°·1 and 37°·4 of mean temperature; after which follows December, with a mean temperature of 38°·6, and March, with a mean temperature of 39°·8. But the year 1869 was of such an exceptional and severe character, that the coldest month of the year was December, when the mean temperature was only 34°·9; while March was the second coldest month, its mean temperature being only 37°·8, or 4°·1 below that of February—a strikingly unusual occurrence.

It has been long observed that, when the cold weather first sets in, it does not prove so fatal to the general population as it does later in the winter, the greater amount of vitality in the people somewhat resisting the depressing effect of the cold at the early part of the season; whereas, when severe cold occurs towards the end of winter, the constitutions of the people having been already weakened by its continuance, the deaths increase to a most alarming extent. This was strikingly illustrated during the past year. The coldest month was December, and it produced 7432 deaths. March, however, though nearly three degrees of temperature warmer, found the people weakened by the long continuance of the cold, and produced 7640 deaths. Had these two months been each of their average temperatures, the deaths during December would only have amounted to 5928, and the deaths in March to 6326. The extraordinary severity of the weather, therefore, during these two months alone caused an increase of 2820 deaths more than would have occurred had the weather maintained its usual character. Even if we compared the mortality of these months with that of the previous year, 1868, which was in many respects near a year of mean mortality, we shall find that the year 1869 yielded an excess of 2436 deaths for these two months.

January and February 1869 were unusually mild months, the prevalent winds being from the south-west and west, with less northerly or easterly winds than had occurred for years; and the consequence was, that there was no truly wintry weather during either of these months till the last week of February. The mean temperature of January was therefore 40·4, and that of February 41·9, and the deaths registered in Scotland were 6619 in January, and 6172 in February,—averaging 213 deaths daily during Janu-

ary, and 220 daily during February. This slight increase of the deaths during February from the mere continuance of the cold weather, even though its mean temperature may rise a degree or two above that of January, is observed year after year. (Table XVI.)

Very different kind of weather prevailed during March. On the 27th February the wind veered to the north and north-west, and the whole of Scotland was immediately covered with snow; the frost was often severe; and during the whole month of March the winds blew with biting severity from the north, occasionally varying slightly to the north-west and north-east. The pernicious effects of these cold withering winds was instantly marked on the health of the people. Every disease increased in virulence and fatality, especially those of the respiratory organs, and the various epidemics which prevailed in different parts of the country, so that the deaths in Scotland rose to 7640 during March, or to 246 deaths daily—the highest proportion attained during the year.

April, as to weather, was an average month, with a mean temperature of 46°·9, which is rather above the average of former years; but so many had been seriously affected by the cold weather of the previous month, and died during this one, that the deaths in April numbered 6650, or were at the rate of 222 deaths daily.

During both May and June the mean temperature was considerably below the mean, apparently produced by the unusual prevalence and severity

---

TABLE XVI.—Meteorology of Scotland for the Year 1869, deduced from observations made at 55 Stations of the Meteorological Society of Scotland, the particulars for each of the Stations having been published in the Quarterly Reports of the Registrar-General for 1869; also, the Number of Births, Deaths, and Marriages registered during each Month of the Year 1869.

1869.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	YEAR.

* As few or no Marriages are contracted in Scotland on Saturday or Sunday, these days are excluded from each month in calculating the daily number of Marriages.

of the northerly winds, which not only blew with a constancy rarely witnessed in Scotland, but with such keenness that, on the 15th, 16th, and 17th of June, the whole of the high ranges of hills in Scotland were covered with snow. The consequence was that, instead of June being one of the months whose mortality was below the mean, it had, with May, a high mortality—nay, a higher mortality than May itself; for May had 207 deaths daily, while June had 212 daily. In fact, these two months had an excess of 1625 deaths above those of the corresponding months of the previous year, and the different state of the weather during the corresponding months of the two years sufficiently accounted for the difference.

July was the warmest month of the year, its mean temperature reaching 59°·3. It was also a month of great drought, and it has been invariably remarked that such kind of weather is attended with much sickness. Accordingly, 5848 deaths were registered during the month, being at the rate of 189 deaths daily.

August was also characterized by its extreme drought, and its mean temperature was below the average, being only 56°·1. The alternations of temperature were also often great. The mortality was therefore at the rate of 174 deaths daily.

As a general rule, September is the month of least mortality in Scotland, after which comes August, and then October. But during 1869 all this was reversed. August proved to be the month of least mortality, after which came October, while September was the third. This fact, of itself, proved what an exceptional year 1869 was.

The mean temperature during September was 51°·2, which was below the average of previous years; but the drought which had lasted for two months came to a sudden termination, and September proved a very rainy month, scarcely a day passing without a shower, and the quantity of water which fell was a half more than the average of former years. Under this great change of weather the health of the people did not improve, so that the daily deaths numbered 176, or two more daily than during the previous month.

During October the mean temperature was the average of former years, being 47°·3; but there was an unusual amount of north and north-west winds, and snow covered the hills from the 14th of the month. The deaths, therefore, still remained high, though not quite so much so as during September, seeing that 175 persons died daily over Scotland.

During November the weather was very much as usual, with a mean temperature of 40°·4; and the deaths, as usual, increased with the fall of temperature, so that 217 deaths occurred daily.

During December the weather proved much colder than usual, its mean temperature being 3°·7 below the average of former years. Dry frost prevailed during most of the month, accompanied by cutting northerly, north-easterly, and north-westerly winds; and under this ungenial weather sickness prevailed to an extent seldom witnessed in Scotland, affections of the respiratory organs being nearly universal. The deaths consequently rose to 7432 during the month, being at the high rate of 240 deaths daily.

These striking facts prove how closely our health and lives are dependent on the kind of weather which prevails. In interpreting these meteorological conditions, and showing how they act deleteriously on the human race, it must be remembered that their influence for evil depends on the state of health of the community whose case we may be considering. The lower the state of health, the more powerfully do these adverse meteoro-

logical agencies act on the person. This is the reason why these agencies exert so much more deadly an influence over the population of our overcrowded towns, than over those in our small towns and in the rural districts. Just in proportion to the overcrowding and the breathing of vitiated air, is the general health of the people deteriorated; so that when any cause comes which induces or increases disease, the inhabitants of the overcrowded town fall a prey to disease to a much greater extent than they do in towns where the population is more widely spread, and where the air breathed is consequently purer.

Our Monthly Reports of the diseases causing deaths in the Eight Towns of Scotland, enable us to trace the influence of weather on each of the diseases which afflict our race. On no class of diseases was this influence seen more strikingly during the last year than on the inflammatory affections of the respiratory organs. Thus, during September, only 229 died from these diseases; but as the temperature fell, and the northerly winds got more keen, the deaths from these diseases increased to 287 in October, to 567 in November, and to 903 in December. Brain diseases only proved fatal to 150 persons in September, but to 260 in December. Heart diseases only cut off 72 persons in October, but 126 in November, and 111 in December. It is a recognised fact that Consumption is always most fatal when the northerly or easterly winds blow with severity in spring; but in 1869 the fatality was much greater than usual in March and May, under the exceptional keenness of the north winds; for while only 225 died from Consumption in October, and 300 in January, no fewer than 408 were cut off in March, and 391 in May. Fever, which caused only 115 deaths in January, caused 189 in March; and though only 118 died from that disease in September, 193 deaths were caused by it in December. Scarlatina caused 114 deaths in July, but 333 in November. Hooping-cough, which caused 61 deaths in September, caused 145 in December. (Table XVII.)

The most instructive Table, however, as to the influence of the weather,

TABLE XVII.—Showing the connection between Atmospheric Phenomena, especially Mean Temperature, and the Deaths from certain Diseases and Classes of Disease, in the Eight Principal Towns of Scotland, during each Month of the Year 1869.

but especially of mean temperature, on the mortality, is that which shows the weekly deaths, alongside of the highest, lowest, and mean temperatures, and the rainfall during each week of the year 1869. (Table XVIII.) In reading that Table, however, it is necessary to remember, that if the extreme cold occurred at the end of a week, the deaths caused by that cold will be found in next week's register; whereas, when the extreme cold occurred at the beginning of the week, the registrations during that week express very accurately the influence of that depression of temperature on the deaths. One or two examples may be quoted. During the weeks ending 13th and 20th February, the mean temperature was 43°·2, and the weekly deaths numbered respectively 611 and 595; but the mean temperature fell to 36°·4 and 38°·4 on the weeks ending 13th and 20th March, and the deaths rose to 700 and 747 weekly; and even when the temperature rose to 40° and to 41° during the two following weeks, being still a lower temperature than during February, the deaths continued at the high rate of 727 and 716 weekly. During the week ending November 6th, with the mean temperature of 45°·3, there were registered 586 deaths; but during the week ending 4th December, the mean temperature was 31°·3 only, and the deaths registered numbered 642; but as the greatest cold occurred on the Thursday night, it was not till the following week that the full effect of the reduction of temperature was seen upon the deaths, when, though the temperature was higher, viz. 36°·9, there were registered 753 deaths, and 751 on the week following.

It is a very interesting and important inquiry, to trace the influence of season and atmospheric vicissitudes on the mortality at different ages. From the want of facts, the most vague theories prevail, and it is with the view of furnishing facts on this subject that Tables XIX. to XXII. have been

---

drawn up. These Tables must be read horizontally, or perpendicularly, according to the kind of information we wish to obtain from them; and the facts are confined to the Eight Principal Towns.

Let us first look at the influence of season on the deaths at each of the four periods of life noted in the Tables. For this purpose we must read the columns perpendicularly, and confine our attention to the corrected deaths given in Table XX.; but it must be remembered that the conclusions deducible therefrom are alone applicable to the year 1869, as they differ considerably from those deduced from a ten years' summary of the same class of facts.

For children under 5 years it will be seen that the lowest mortality occurred in the month of September, 946 deaths having only occurred among such during that month. The next most healthy months were August and October, when 1005 deaths respectively occurred. July was the next most healthy month, 1132 deaths only having occurred; and it was with extreme surprise that it was found that January was the fifth most healthy month for children under 5 years of age, 1183 deaths having occurred.

The most fatal month for children under 5 years during 1869 was March, when 1455 deaths occurred. Then followed December, with 1367

TABLE XIX.—Monthly Mortality at Four Periods of Life in the Eight Principal Towns of Scotland during 1869, and Proportion at each Age in every hundred Deaths per Month.

September	946	305	604	309	2164	810
October	1005	291	579	313	2188	819
November	1278	316	824	463	2881	1077
December	1367	312	900	583	3162	1184
YEAR	14,345	3484	9116	5113	32,058	12,000

deaths; November, with 1278 deaths; February, with 1271 deaths; April, with 1263 deaths; May, with 1224 deaths; and June, with 1216 deaths.

1869, however, was an exceptional year, and the proportional average fatality of each month to children under 5 years of age can only be obtained by taking the average of a number of years. Tables XXI. and XXII. give the facts for the ten years 1856–1865.

The first column of Table XXII. shows that during these ten years the month of least mortality to children under 5 years of age was September, when 8649 deaths occurred. Then followed June, with its 8675 deaths; August, with its 8889 deaths; July, with its 9052 deaths; May, with its 9058 deaths; October, with its 9078 deaths; and April, with its 9929 deaths.

During these ten years the month most fatal to children under 5 years of age was February, when 11165 deaths occurred. Then followed January, with 11066 deaths; December, with 10590 deaths; November, with 10458 deaths; and March, with 10359 deaths.

These facts show how very exceptional the weather and the mortality were in 1869. For while during a ten yearly period February was the most fatal month to children under 5, and March was only the fifth fatal month; during 1869 March was the most fatal month, while February only came fourth.

TABLE XXI.—Monthly Mortality at Four Periods of Life in the Eight Principal Towns of Scotland during the Ten Years 1856–1865, and the Proportion at each age in every hundred Deaths per Month.

Months.	Absolute Number of Deaths, Ten Years 1856–1865.					Proportion at each Age in every Hundred Deaths per Month.

December	10590	2258	6344	3893	23085	1088
Ten Years	116,968	26,075	70,744	40,868	254,645	12,000

It is a remarkable fact, that in ordinary seasons there is less variation in the monthly mortality of persons between the ages of 5 and 20 years than at any other period of life. Thus, by the ten-yearly Table, second column, it will be seen that, though the months of least mortality were in order, August, September, October, July, and June, and the most fatal months in order, February, January, March, December, May, and April, the difference was not nearly so great as at the earlier years of life.

During 1869, however, the normal rule was departed from, and two of the months generally least fatal to persons between 5 and 20 years of age became fatal months. Thus, during 1869, the most fatal months to persons from 5 to 20 years of age were in order—June, 336 deaths; November, 316 deaths; March and December, each with 312 deaths; and September, with 305 deaths. The least fatal months to persons at these ages were February, with 213 deaths; August, with 258 deaths; July, 278 deaths; May, with 283 deaths; April, with 289 deaths; January and October, each with 291 deaths.

Thus, again, the exceptional character of the year 1869 was manifested; for while on the average of years June has six months more fatal than itself to persons between 5 and 20 years of age, in 1869 it was the most fatal month of the whole year.

On a ten years' average to persons between the ages of 20 and 60 years —the vigorous period of life—September was the month of least fatality; after which came in order, October, August, July, June, and November. And while January proved the most fatal month, there followed in order, February, March, December, May, and April.

During 1869, however, October proved the month of least fatality to persons from 20 to 60 years of age; after which followed in order, September, August, July, January, and June. The most fatal month to persons at that age was March; after which followed in order, December, November, February, April, and May.

The exceptional character of the year 1869 was therefore also strongly shown at this period of life, inasmuch as March, which in general is the third of the most fatal months to persons between 20 and 60 years of age, proved the most fatal in 1869, while December, which is usually the fourth most fatal month, became the second.

The hurtful effects of cold on persons above 60 years of age is strikingly exemplified in the fourth column of Table XXII. Thus, in a ten years' period, the most fatal month was January, with its 4837 deaths; and then February, with 4165 deaths; December, with 3893 deaths; March, with 3865 deaths; April, with 3746 deaths; and November, with 3668 deaths. The least fatal months to persons at this advanced age were September, with only 2536 deaths; October, 2679 deaths; August, 2698 deaths; July, 2886 deaths; May, 3180 deaths; and June, 3215 deaths.

During 1869, however, an exceptional mortality occurred. The most fatal month to persons above 60 years of age was December, when 583 deaths occurred; then followed in order, March, 543 deaths; January 504 deaths; February, 477 deaths; April, 464 deaths; and November, 463 deaths. The least fatal months to persons at the advanced ages during 1869, were in order, September, 309 deaths; October, 313 deaths; August, 314 deaths; July, 328 deaths; May, 371 deaths; and June, 444 deaths.

We thus again see the exceptional nature of the mortality during 1869, and its dependence on the kind of weather which prevailed; for while, in ordinary years, to persons above 60 years of age, three months precede March in fatality, only one month had a higher mortality during 1869.

When these Tables are read horizontally, they show the relative effect which season has on the mortality at each several age. It will be seen that the effect of season on the mortality at each period of life, in so far as regards the proportions in which the population is cut off at each age, does not differ so much as might have been expected,—that, in fact, increase of heat or of cold, however potent in increasing or diminishing the mortality, does not greatly alter the proportion which the deaths at the different ages hold to each other. In pointing out the influence of season on the mortality at each age, it was shown that that influence was less powerfully shown between the ages of 5 and 20 years than at any other. In other words, that the mortality at that period of life was less affected by the monthly vicissitudes than that at all other periods of life. Hence, when we compare the proportions dying at each age during each month, we find that during the healthiest months, when the mortality at every age is lowest, the relative proportion of those who died between the ages of 5 and 20 years seems to be at its highest. This is exactly what it ought to be. As the deaths at that age vary less during each month than do the other deaths, their relative proportion seems somewhat higher during the healthier months.

Taking the whole ten years, however, these Tables show, that of every hundred persons who died in the Principal Towns during that period, 45·93 were under 5 years of age, 10·25 were between 5 and 20 years, 27·78 were between 20 and 60 years, while 16·04 were above 60 years of age.

VACCINATION IN SCOTLAND, 1868.

This is the Fifth Report relative to the vaccination of children in Scotland, and it shows what proportion of the children whose births were registered during the year 1868 were vaccinated according to the provisions of the Scottish Vaccination Act, 26 and 27 Vict. c. 108. By the provisions of that Act, a large proportion of the children born during 1868 must be vaccinated during the year 1869. The Report, therefore, having reference to vaccination, must always be one year behind that having reference to the births, deaths, and marriages.

From the vaccination returns just received, it appears that, of the 115621 children whose births were entered on the registers during the year 1868, 102140, being 88·340 per cent., were successfully vaccinated; 914, or 0·791 per cent., had their vaccination postponed from bad health or other

---

TABLE XXIII.—Deaths from Small-pox in Scotland, 1855–1869 inclusive.

YEARS.	Small-pox Deaths.	YEARS.	Small-pox Deaths.
1855	1309	1863	1646
1856	1306	1864	1741
1857	845	1865	383
1858	332	1866	200
1859	682	1867	100
1860	1495	1868	25*
1861	766	1869	100*
1862	426		

* Estimated from the ascertained Small-pox Deaths in the Eight Principal Towns of Scotland, as compared with the total Small-pox Deaths in all Scotland during the Ten Years 1855–1864.

causes; 514, being 0·444 per cent., were found to be insusceptible of vaccination—277 from constitutional insusceptibility, 7 from having had Small-pox, and 230 from having been previously vaccinated; 9440, being 8·165 per cent., died before they could be vaccinated; while 2613, being 2·260 per cent., had removed from the district before vaccination could be enforced, or were otherwise unaccounted for. (Table XXIV.)

The fact, however, which we wish to learn is, what proportion of the children who survived the age when they could be vaccinated are protected from the ravages of Small-pox by vaccination. Table XXV. is drawn up with the view of showing this fact, both for the year 1868 and also for the previous years during which the Vaccination Act has been in operation.

By that Table we learn that, of the surviving children of 1868, no fewer than 96·194 per cent. were successfully vaccinated; that 0·861 per cent. had their vaccination postponed from bad health or other causes; that 0·484 per cent. were insusceptible of vaccination; while 2·461 per cent. had removed from the district before vaccination could be enforced, or were otherwise unaccounted for. It is this latter class who are alone dangerous to the community, as, from not being protected by vaccination, they are liable to Small-pox, while the migratory habits of their parents make them

TABLE XXIV.—VACCINATIONS in SCOTLAND, 1864–1868. Number of Births each Year, and Proportions Vaccinated, Dead before Vaccination, &c.

Years.		Successfully Vaccinated.	Vaccination Postponed.	Insusceptible of Vaccination.			Died before Vaccination.	Removed from District before Vaccination, or otherwise not accounted for.	TOTAL BIRTHS.*

more dangerous to the community than any other class, seeing they are the fruitful means of introducing Small-pox into the otherwise healthy towns or districts which they frequent.

Small-pox, like every epidemic disease, has its periods of prevalence and of decline; and hitherto we have refrained from attributing the noted decline of Small-pox in Scotland to the successful working of the Vaccination Act, lest, after all, it should prove that the decline arose alone from the past years being those when Small-pox would of itself have been in abeyance. As Table XXIII. will show, during the first year when the Vaccination Act came into operation Small-pox was epidemic in Scotland, and caused the large number of 1741 deaths. At no former period of which we have any certain records, has an epidemic of Small-pox been longer absent from the people than three years; but since 1864 the number of cases of Small-pox has been gradually becoming fewer and fewer, so that in 1868 only 25 deaths occurred, and during the present year they cannot have exceeded 100 over all Scotland—a very large proportion of these having occurred in Greenock among those unprotected by vaccination.

Seeing, therefore, that for a period of five years Scotland has had no epidemic of Small-pox, and at no former period of which we have certain records has the mortality from Small-pox been so low, it seems only reasonable to infer that it is the successful working of the Vaccination Act which has produced this desirable result.

Many of the Registrars have appended notes to their returns relative to the working of the Vaccination Act, and extracts from several of these are given in the Appendix. These notes, while they agree with those given in former Reports in showing that the Act in general works successfully, also seem to demonstrate that some amendments are required to make it work more smoothly and more effectually over the country, and also for the purpose of removing certain decided hardships and the great risk to life to which the inhabitants of the Insular Districts are exposed when they endeavour to comply with the requirements of the present Act. As these suggested amendments have been commented on at length in former Reports, we simply make reference to them here lest their existence should be overlooked.

I have the honour to be,

Sir,

Your most obedient Servant,

JAMES STARK.

General Registry Office of Births, etc.,
Edinburgh, 8*th March* 1870.

The absolute highest temperature, viz. 81°·5, was noted at Aberdeen in August; and the absolute lowest, viz. 13°·0, at Glasgow in December.

NOTE.—The figures under each month are the mean results from the eight Stations, as published in the Monthly Returns.

Registered during 1869 in the Town and Landward portions respectively of all the Burghal Districts of Scotland (with the exception of the Eight Principal Towns), and of all the other Districts embracing Towns with a population of 2000 and upwards at the Census of 1861.

(In a few cases the columns headed 'Town (or Burgh)' include the events occurring in adjoining villages; while in some instances the figures pertaining to the 'Landward' portion of the Districts embrace those occurring in one or more small Towns. In four or five cases, where a Town or Burgh happens to extend to two Registration Districts, the Births, etc., pertaining to the entire Town or Burgh are collectively stated.)

* Springburn.—Thirteen of the fourteen Illegitimate Births, and 394 of the 432 Deaths, in the Landward District, took place in Barnhill Poorhouse.

† Dalziel.—Five of the eleven Illegitimate Births in the Town District took place in Motherwell Poorhouse, the mothers belonging to other parishes.

‡ Partick.—Eighty of the 152 Deaths in the Landward District occurred in the Gartnavel Lunatic Asylum.

APPENDIX.

EXTRACTS FROM THE REGISTRARS' NOTES RELATIVE TO THE WORKING OF THE VACCINATION ACT.

I. NORTHERN DIVISION.

1. Shetland.

3. (2.) Sandwick and Cunningsburgh.—Of the 66 births registered during 1868, there are still twelve unaccounted for, although it is quite possible they may have been vaccinated; but from some of the parents not having money at the time to pay the vaccinator's fee, they do not get delivery of the certificate. In some cases the certificate has not been handed in until nearly a year after the operation has been performed.

4. (1.) Fetlar.—The same drawbacks that have been noticed in former returns still exist. It is not without cause the poor parents complain loudly of being under the necessity of exposing their infants to the risk of being carried not only miles of land road, but also across dangerous sounds to a distant island. In many cases the health of the mother is seriously injured.

12. (3.) Papa-Stour.—Vaccination has been more regularly attended to for the year 1868, than during previous years. One great barrier to the working of the Act here is, the poverty of the people. Out of 23 cases of vaccination, on one occasion 20 of the parties had to borrow the money to pay the vaccinator, and in several cases could not obtain it. I have before recommended a system of parish assessment for the purpose, when vaccination, the same as registration, would go on regularly without murmur or delay.

2. Orkney.

17. Firth and Stennes.—The Act is well attended to, but costs the Registrar as much trouble as the Registration Act does, consequently the remuneration is far from adequate.

29. South Ronaldshay.—The Act works well, and the people seem willing to have their children vaccinated.

30. Stromness.—The Act is strictly attended to, and works smoothly.

II.—NORTH-WESTERN DIVISION.

5. Ross and Cromarty.

Mainland.

66. (1.) Northern District of Gairloch.—The cause of the five not being vaccinated is, that the vaccinator has been confined for six weeks by typhus fever, and no other person has been appointed in his place.

66. (2.) Southern District of Gairloch.—The operation of the Act is still very irregular. The people are become indifferent as to the time of sending in the certificates, one of which was received on 3d January 1870, the child for which it was granted being then 21 months old, and this notwithstanding that the time was prolonged from six to twelve months. The parents of the seven children marked in col. 7 rest their defence on the vaccinator's illness, he being confined for some time back, and still lies dangerously ill; no other vaccinator being nearer than Ullapool, which is from 30 to 50 miles distant from some parts of this parish. Unless the Parochial Board takes action, and uses more stringent measures against defaulters, the Act will soon become a dead letter in Gairloch.

74. Lochalsh.—There is no improvement in the working of the Act—indeed, quite the reverse, as the large number of entries (12) for whom no certificates have as yet been received fully testifies. It is not for me to say how this happens; I merely state the fact, and leave those most concerned to account for it.

75. Lochbroom.—The Act is much better attended to now than formerly. The vaccinator endeavours to do his duty willingly and faithfully, and the docile inhabitants are doing their best; but in such a wide and wild parish, many difficulties will occur to prevent punctual attendance in every case. The most of the cases in col. 7 will be vaccinated in course of a short time. Very few indeed escape without being vaccinated.

83. Tarbat.—The Act works very well, considering the distances many of the parents have to travel to meet the doctor. The fee presses pretty heavily on ploughmen and labourers.

Insular.

88. Stornoway.—The vaccinators are very attentive to their duties, and parents and guardians, in general, are paying great attention to the requirements of the Act.

6. Inverness.

Mainland.

91. Ardersier.—The Act works pretty well,

yet in many cases notices have to be issued before the certified schedules are returned. This arises from the fact that, to save trouble on their own part, parents expect either the Registrar to remind them, or the medical practitioner duly to attend to the various cases within the statutory period.

97. (1.) GLENELG.—The prevalence of Measles was the cause of postponement in six cases. The Act is working well.

97. (2.) KNOYDART.—There being no medical officer in the parish at present accounts for there being no vaccinations for 1868.

97. (3.) NORTH MORAR.—There is considerable difficulty in getting some of the parents to comply with the requirements of the Act, eight of the 13 children whose births were registered in 1868 being as yet unvaccinated.

104. LAGGAN.—The two cases unaccounted for are twin children of a travelling musician, who were removed from the parish the second day after their birth, and where they cannot be discovered.

106. PETTY.—Vaccination, with few exceptions, is very regular.

III.—NORTH-EASTERN DIVISION.

7. NAIRN.

121. AULDEARN.—There was less difficulty in obtaining the returns for 1868 than for the previous years. Only two cases caused any great annoyance to the Registrar; the one in consequence of the ignorance of the parents, and the other on account of the child being ill for some time, and the number of Schedule B's required to be written for.

122. CAWDOR.—Cases requiring notices are considerably on the increase.

123. NAIRN.—Owing to the carelessness of parents, the proper carrying out of the spirit of the Act involves a vast amount of work most inadequately remunerated. After a five years' trial, I am still strongly of the opinion, that were the charge of one shilling made for every Registrar's notice (pursuant to sec. 17) when sent out, the Vaccination Act would be better attended to, and much time and trouble saved to all parties.

8. ELGIN (OR MORAY).

131. DUFFUS.—Inconvenience is experienced on account of there being no resident medical practitioner in the parish.

132. (2.) ROTHIEMURCHUS.—Vaccination well attended to. No case of default has yet occurred, but the Act requires to be strictly enforced.

9. BANFF.

148. BOTRIPHNIE.—The Act works well, but Registrars have too little pay.

153. FORDYCE.—Parties seem wishful to comply with the statute, though somewhat inclined to procrastinate, and, in consequence, in not a few cases require the Registrar's notice served on them.

157. (1.) GLENLIVAT.—Vaccination generally well attended to; a few require the statutory notice to remind them.

164. RATHVEN.—The Act works fairly. The only objection is the insufficient remuneration, which ought to be at least sixpence for each entry.

10. ABERDEEN.

182. COULL.—The schedules have been all got in, the last one having been sent in shortly before the close of 1869. The mother was lost sight of for nearly a year.

194. FORGUE.—From the Registrar's experience of the working of the Act, he would suggest that some check be imposed upon the facilities for postponing vaccination.

199. GLASS.—The child removed from parish without being vaccinated was the illegitimate child of a farm-servant, who, along with the child, disappeared soon after the birth took place. There is no difficulty with the parents; they seem all quite willing to have their children vaccinated.

200. GLENBUCKET.—The Act is working very well, being now better understood.

210. KING-EDWARD.—The Act is all that could be desired, so far as it goes, with the exception of those perplexing postponements, for which the Registrars are underpaid, or rather not paid at all.

213. KINTORE.—The Act works remarkably well. The duties devolving on the Registrar through its operation are, however, very trying, and the payment for the work done is very inadequate.

214. LEOCHEL-CUSHNIE.—There are complaints on the part of parents that the medical practitioner requires to be called upon several times before he will vaccinate.

217. LOGIE-COLDSTONE.—Only one case has occurred in the experience of the Registrar, of a parent delaying the vaccination of his child on the ground of entertaining objections to it; but it is becoming more and more the practice with parents to neglect the requirements of the Act, till they receive the statutory notice from the Registrar.

220. LUMPHANAN.—The only difficulty that has ever occurred in working the Act, was the complaint of the poorer classes of the charges of the medical practitioners, who, on their part, were rather unwilling to go perhaps a good distance, when there was but little prospect of payment. To obviate the difficulty, the Registrar arranged with the vaccinator to attend several times a year at a central part of the parish, and vaccinate all the children of the labouring classes who should be brought to him, at a fee of 1s. 6d. prepaid. The arrangement is giving great satisfaction to both parties, as the poor get their children vaccinated at little cost, and the medical practitioner, though the fee be small, is sure of it, and it saves the Registrar from a good deal of trouble in sending notices.

233. PITSLIGO.—The Act still continues to work badly. The postponements for 1867 were 24; for 1868, 22; and for 1869, 33. As was remarked last year, a certificate of successful vaccination is rarely received without first sending a notice to the parents, and, as noted above, in 33 instances out of 78 during the year just closed, Schedule B has been returned. This, too, is always done within the prescribed ten days (sometimes at the very last hour), so that the Registrar has had no opportunity of lodging a complaint with the Parochial Board, which might have the effect of causing a little more punctuality to be observed. There is sometimes a suspiciously short interval between the dates of Schedules A and B. In one case a notice was sent to the parents on the 29th October; Schedule B was returned dated November 6th, and Schedule A November 22.

238. SKENE.—There is often trouble in getting in the schedules. Much of this would be avoided if the vaccinator were paid by the Parochial Board, as the Registrar is paid, and not by the parents themselves.

11. KINCARDINE.

251. (1.) BANCHORY-DEVENICK.—Vaccination attended to with punctuality.

266. NIGG.—The entry in col. 7 was that of a child which was removed to England previous to vaccination.

IV. EAST-MIDLAND DIVISION.

12. FORFAR.

282. (1.) ST. PETER (DUNDEE).—The Act is working satisfactorily. Out of the total of 891 births, 783 have been successfully vaccinated; whilst of the balance, 94 have died before vaccination, 5 have been certified as insusceptible, and only 9 have left the district before vaccination.

282. (3.) ST. CLEMENT (DUNDEE).—The Act is very fairly observed, only 3½ per cent. of the children registered being unaccounted for. These children belong, without a single exception, to the more humble of the working classes, who in many instances have been obliged to emigrate from the town in search of employment. The Registrar continues of opinion that, if the time were restricted to three months, it would have a most beneficial effect; he observes, also, that the children of the better classes are invariably vaccinated before that time.

282. (4.) ST. ANDREW (DUNDEE).—The Act continues to work well. During the agitation in England, occasional depreciatory remarks were made to the Registrar by parents, on receiving Schedule D; but on being apprised of the remarkable fact that Small-pox was virtually an extinct disease throughout Scotland, disapproval in most cases was turned to approval. The cases unaccounted for almost exclusively belong to the nomad portion of the lowest stratum of the labouring classes, who have migrated in search of work. Some of the postponements have run nearly eighteen months.

296. KINNELL.—Vaccination remarkably well attended to.

312. MONTROSE.—The vaccinations are well attended to, as the return shows, although many parents require notices sent to them. The Registrar may mention, as many others have done, that the remuneration is altogether inadequate to the work performed.

13. PERTH.

331. BALQUHIDDER.—The Act works pretty well. Parents seem to be alive to their duty under it. The chief difficulty is the distance to the vaccinator, which, with a tendency to leave vaccination undone to the last moment, leads to annoyance to vaccinators, parents, and Registrars, that might be avoided were an endeavour made to get the children vaccinated at the third or fourth month, before teething commences.

342. CRIEFF.—As a rule the Act works well. In most cases, if not all, where inattention is given, the parties have left the district.

380. METHVEN.—The four unaccounted for are the children of Irish labourers, whom it is sometimes most difficult to trace.

14. FIFE.

411. BURNTISLAND.—As will be seen by the return, the Act is being quite successfully carried out, the whole of the entries in the Birth Register for the year having been successfully accounted for.

420. CUPAR.—The Act works most satisfactorily.

426. DYSART.—The births of 333 children were registered in 1868. Of these, 298 were successfully vaccinated, 32 died before vaccination, and in two cases the vaccination was postponed. In the remaining case, that of an illegitimate child, the mother left the district shortly after the child's birth and before it was vaccinated, and cannot be traced.

442. KIRKCALDY.—There is still a very great amount of trouble in getting from the parents the vaccination certificates; but, by taking this trouble, the Act has wrought very successfully, as the return will show. Of the 11 cases unaccounted for, the Registrar expects to get in certificates for seven.

453. ST. ANDREWS AND ST. LEONARDS.—The Vaccination Act works well on the whole, and is strictly attended to by the people, except in a very few instances.

459. WEMYSS.—The postponed case is that of a weakly child, running its fourth postponement.

16. CLACKMANNAN.

468. TILLICOULTRY.—The Act seems to work well.

V.—WEST MIDLAND DIVISION.

17. STIRLING.

485. LARBERT.—Parents are all very attentive to their duties.

490. STIRLING.—The Act is still working well.

18. DUMBARTON.

495. CUMBERNAULD.—Some complaints occasionally of the injurious effects of vaccination in causing eruptions on head and body, and decline. In one case, a short time ago, the father of the child decidedly ascribed its death to vaccination. He brought the certificate of vaccination along with him when he came to register the death of the child.

503. ROW.—The disease of small-pox is now almost unknown amongst the youthful population of the parish. The Act is now cheerfully complied with. The working population now consider compulsory vaccination a great benefit.

19. ARGYLL.

Mainland.

505. (1.) ARARACLE.—The only circumstance to be noted in connection with the operation of the Act in this, as in all other country districts, is the amount of trouble it gives the Registrar for the small pittance allowed him for that trouble.

510. DUNOON AND KILMUN.—The schedules are now generally returned before the six months have elapsed. The list of defaulters last half-year had only three names on it.

513. INVERARAY.—There is only one case in which no certificate has been received.

517. (2.) DALAVICH.—There are two cases of successful vaccination in which medical certificates have been refused from non-payment of fees.

521. KILMARTIN.—Vaccination continues to be well attended to. The Registrar is very seldom under the necessity of issuing notices. The parishioners seem to be fully aware that vaccination is an incalculable boon to the country at large.

523. KILMORE AND KILBRIDE.—Vaccination has been suspended for the last six weeks, on account of the prevalence of measles.

526. LOCHGILPHEAD.—One of the parochial vaccinators died in June 1869, and at his death left a number of cases of successful vaccination

without certificates. The vaccinators complained several times during the year of the inefficiency of the lymph supplied from London.

531. (1.) SADDELL.—The entry in col. 7 is that of a defaulter from sheer neglect, who, although repeatedly warned of his duty by statutory letter and otherwise, the case also having been referred to the Inspector of Poor, continues refractory, and no certificate is yet obtained from him. The child in question was born November 2d, 1868. Another defaulter formerly reported has not yet sent any certificate regarding his daughter, born 16th July 1866.

534. (2). STRACHUR.—The Act continues to operate successfully; but the Registrar has some trouble in working it, for which labour 2s. is, in his estimation, scarcely adequate remuneration.

535. TARBERT.—Parents are getting their children vaccinated willingly, the only grudge being the payment to the vaccinator.

Insular.

540. KILCHOMAN.—The Act continues to work satisfactorily, though the Registrar has occasionally to warn parents of the expiration of the six months, by sending statutory notices. Considering the amount of additional labour imposed upon Registrars by the Vaccination Act, the remuneration is quite inadequate.

551. (1.) TYREE.—Vaccination is performed at the 'convenient time,' without regard to the limitations of the Act. And the convenient time for parents and vaccinator seldom happens to coincide. The fee is the principal cause of the delay on the part of the people, and where, as here, they are mostly all very poor, and the Parochial Board has to pay, it gives the Registrar a great amount of trouble. The vaccinator having to attend to the medical wants of two islands, separated by a sound often impassable for weeks, and having a population of about 5000 inhabitants, cannot always be at hand when his services may be required for vaccination.

VI. SOUTH-WESTERN DIVISION.

21. RENFREW.

560. CATHCART.—It is difficult to get the medical men to send the papers, and the parents neglect to transmit them after they have received them. In this district there are remarkably few postponements.

564. (1.) MIDDLE DISTRICT OF GREENOCK.—Two children died from Small-pox. The one was 2 years old and born in Ireland, and the other was aged three months. They were *not vaccinated.*

564. (2.) EAST DISTRICT OF GREENOCK.—During the year two children, aged respectively about 4 years, who were born in Ireland, and never vaccinated, died from Small-pox.

565. HOUSTON AND KILLELLAN.—The constant changing of the labouring population is the reason why so many cases are entered in the column "Removed from the District before Vaccination, or otherwise unaccounted for," although when leaving the parents are particularly requested to send a certificate by post.

569. KILMALCOLM.—The four removals before vaccination are attributable to the migratory habits of the navvies who were working on the Greenock and Ayrshire Railway. The vaccinator of the parish is very assiduous in the discharge of his duties.

571. MEARNS.—In this district the only difficulty in the working out of the Vaccination Act, is the carelessness of parents and guardians. The notices to defaulters are sent at the end of every month, so that, generally speaking, they are never more than a week or two behind.

574. PORT-GLASGOW.—The number of postponements in this district is very great, 113 since this time last year. This may be accounted for, to some extent, from the fact that some of the medical men are in the habit of giving certificates of postponement instead of certificates of successful vaccination, when the parents are not able to pay the charge, 1s. 6d. The parents frequently leave the vaccination over till the six months allowed are expired, and postponement then becomes necessary, as the children then are frequently teething, so that it would be better were the time allowed shortened to four months.

22. AYR.

583. COYLTON.—The Vaccination Act works well, the people being attentive to its observance. Many, however, demur to the payment of a vaccination fee, and a number pay nothing to the medical officer. It would have been better had the Act authorized the medical officer to uplift his fees from the registration assessment.

597. KILMARNOCK.—The Vaccination Act continues to work well, but it requires much attention on the part of the Registrar, otherwise it would be neglected by many. The greatest difficulty encountered is getting returns from those who remove from the district, in most of which cases the parties cannot be traced. The unaccounted for and removed during 1868 are 14, which is double the number of the previous year.

598. KILMAURS.—There is no difficulty in getting the provisions of the statute carried out.

609. OCHILTREE.—The working of the Act has hitherto been a complete success. Its influence is demonstrated by the fact, that for years there has not been a single case of Small-pox in the parish.

23. LANARK.

644. (3.) BRIDGETON (GLASGOW).—The vaccination certificates, as usual, have been well returned, there being only 53 removed from the district before vaccination or otherwise unaccounted for, out of 2198 births. During the year, there were no cases of Small-pox.

644. (9.) TRADESTON (GLASGOW).—For 1868 there are only 23 defaulters out of 1897 entries. Having come across the following interesting paragraph relative to vaccination in an address delivered by Dr. Valentine, physician to His Highness the Maharajah of Jeypore, India, I have taken the liberty to extract it. He says: 'One peculiar feature attending the labours of the medical missionary in that part of the country, was the readiness with which the women came forward of their own accord to have their children vaccinated.' (*Vide* 'United Presbyterian Missionary Record' for December 1869.)

652. (3.) EASTERN DISTRICT OF OLD MONKLAND.—The dulness of the iron trade during the year 1868 was the cause of five families leaving the county, which necessitated the sending of 40 vaccination notices. This is some proof of the arduous duties entailed upon the Registrar.

654. RUTHERGLEN.—The Vaccination Act continues to work well, though many of the parents require notices sent them, in order that the schedule may be returned within the specified time. One man has absolutely refused to get his child vaccinated, and the case has been handed over to the Parochial Board.

656. STONEHOUSE.—Vaccination is extremely well attended to.

660. Wiston and Roberton.—At times it is rather troublesome to get the statutory provisions complied with, and much attention is required to get the parties to return the schedules in time. And all for *threepence* each!

VII.—SOUTH-EASTERN DIVISION.

25. Edinburgh.

689. Inveresk and Musselburgh.—As stated in my last report, the period of six months seems too long, and allows many to get away from the district.

695. Newbattle.—The Registrar frequently does not receive the certificate of successful vaccination till long after date, owing to the medical men retaining it till they enforce payment of their account. The medical men are extremely remiss in regard to certificates of all sorts. For example, the Registrar has to-day received a successful vaccination certificate in which the doctor has only filled in the child's name, dated and signed the schedule, without giving the father's name, residence, or the district and county of birth. One in fifty of the medical certificates (Schedule G) is not received till a requisition is sent. All this entails endless and unrequited trouble on Registrars.

26. Haddington.

725. Yester.—The certificates have been punctually delivered to me within the time prescribed.

27. Berwick.

730. Chirnside.—The Vaccination Act continues to work well. During the past year the Registrar had only to send one notice, which was instantly attended to.

733. Coldstream.—The Vaccination Act is working remarkably well; even parties who have removed to England are careful to send certificates of vaccination, though performed by English practitioners.

736. Earlston.—In most cases the requirements of the Vaccination Act have been complied with within the statutory period.

748. Lauder.—No part of the Registrar's work costs so much trouble as the Vaccination Act. Every now and again a day has to be devoted towards hunting up defaulters.

28. Peebles.

766. Manor.—The Vaccination Act is strictly attended to, there having been no defaulters in any one case since the new system of vaccination came into operation.

771. Traquair.—A few cases occurred requiring notices, but the parents generally blamed the medical attendant.

VIII. SOUTHERN DIVISION.

30. Roxburgh.

787*a*. Eckford. — The Registrar has considerable difficulty in getting the certificates lodged within the statutory period, the parents saying that the fault lies with the doctor, who is not at home when they go with the child for vaccination. One told me that his wife had been once at Jedburgh and twice at Kelso before she could get the operation performed.

790. Hobkirk.—As regards the vaccination of their children, parents are very attentive.

811. Yetholm.—A medical man being stationed in the parish, the schedules are regularly sent in.

31. Dumfries.

828. Half-Morton.—With one exception, I have had no difficulty in getting the vaccination certificates; but there is a tendency to postpone the vaccination to the limit of the time allowed.

840. Lochmaben. — Parents appear not to take so much trouble upon themselves as in former years, and thus greater attention on the part of the Registrar is required.

850. Torthorwald.—Among the labouring population there is general murmuring at being obliged to carry their infants, during all seasons, so far as Dumfries, and, in addition, to have to pay two shillings or half-a-crown to the vaccinator. A number have required to be served with the statutory notices.

32. Kirkcudbright.

858. Borgue. — The Vaccination Act has worked well.

862. Corsock Bridge. — The Vaccination Act is still working well.

33. Wigtown.

901. Wigtown. — Vaccination is generally well attended to, but a few require to be reminded by having notice sent them. The two postponements are in consequence of the children having skin disease.

THIRTEENTH

DETAILED ANNUAL REPORT

OF THE

REGISTRAR-GENERAL

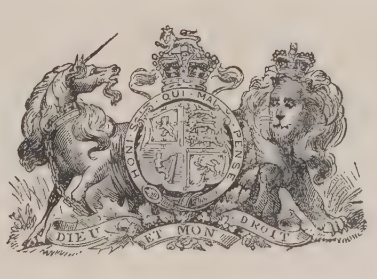
OF

BIRTHS, DEATHS, AND MARRIAGES

IN SCOTLAND.

(ABSTRACTS OF 1867.)

Presented to both Houses of Parliament by Command of Her Majesty.



EDINBURGH:
PRINTED BY MURRAY AND GIBB,
FOR HER MAJESTY'S STATIONERY OFFICE.
1869.

REPORT.

TO THE

RIGHT HON^BLE. H. AUSTIN BRUCE, M.P.,

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, *December* 31, 1869.

SIR,

IN conformity with the requirements of the seventh section of the Scottish Registration Act, 17 and 18 Vict. cap. 80, at the close of the year 1867 I submitted to the Secretary of State for the Home Department a General Abstract of the Births, Deaths, and Marriages registered in Scotland during that year, together with a short explanatory statement relative to the same.

Along with that was transmitted my Third Annual Report on Vaccination, conform to the nineteenth section of the Scottish Vaccination Act, 26 and 27 Vict. cap. 108.

I have now the honour to forward to you my Detailed Report for the same year, with relative Tables.

In many countries the mortality is greatly influenced by the abundance and price of the provisions, but in Scotland no appreciable connection has as yet been traced between the two. In 1867 the price of all kinds of provisions was high, yet the mortality was much below that of the four previous years, when all kinds of food were abundant, good in quality, and cheap.

Though the Marriages did not rise above the average in 1867, yet the birth-rate was high.

Being desirous of ascertaining whether the Births and Marriages were subject to the same law of increase, in proportion to density of population, as has been so often proved to be the case with regard to the Deaths, I caused to be prepared a series of Tables which throw light on this important subject. These

show, for a period of ten years, the number and relative proportions of the Births, Deaths, and Marriages in each of the four groups of districts into which I divided Scotland, according to density of population—viz. Principal Towns, Large Towns, Small Towns, and Rural Districts. The facts thus elicited seem to prove, that if density of population increases mortality, which is an undoubted fact, there is an exact compensation for this in the increased number of Marriages and of Births. As a general rule, it was found that the larger the town, or the more dense the population, the greater was the proportion of its Births, Deaths, and Marriages; and that, as the towns get smaller, the proportions of each and all of these events diminished, till they merged in the low proportions peculiar to the Rural Districts.

The state of elementary education among the people, as indicated by the number of those who were able to sign their names in writing in the Marriage Registers, was highly satisfactory—89·41 per cent. of the men, and 79·27 per cent. of the women who married in 1867, having been able to sign their names in writing.

So far as it has gone, the Vaccination Act seems to have been a great success in Scotland, and under its provisions the mortality of Small-pox has been reduced nearly as low as the most perfect legislative measure could accomplish. A few slight modifications of some of its provisions, which in former Reports I brought under the notice of the Home Secretary, would do much to render the Act more perfect, and still further increase its efficacy in the diminution of Small-pox.

In transmitting this Report, I am happy to be able to call your attention to the fact that we have now been able to wipe off the arrear of five years which existed in 1861, when the series of our Detailed Annual Reports commenced. These Reports are now brought up to as close a proximity with the current year as is possible; for, under the statutory arrangement by which we are regulated, an arrear of two years must always exist.

I have the honour to be,

Sir,

Your faithful Servant,

W. PITT DUNDAS,

Registrar-General.

REPORT TO THE REGISTRAR-GENERAL,

BY JAMES STARK, M.D., F.R.S.E.

SIR,

THE year 1867, to which this Report refers, was one of average commercial and manufacturing prosperity. The rash speculations, and consequent losses experienced in commercial and financial circles towards the close of 1866, caused the year to open with a quiet money market, and a steady but rather restricted trade; but before the close of the year, from the market getting overstocked and the prices of goods falling, the wages of the manufacturing population were obliged to be lowered. As the harvest of 1867, like that of its predecessor, was found to have been short,

---

TABLE I.—POPULATION estimated to the middle of each year; with the Number of BIRTHS, DEATHS, and MARRIAGES registered in Scotland during each of the Years 1855 to 1867, and their Proportion to the Population; also the Illegitimate Births, and the Excess of Births over Deaths.

YEAR.	Estimated Population.	BIRTHS.		Deaths.	Marriages.	Excess of Births over Deaths.	Proportion to every 100 Persons living.		
		Total.	Illegit.				Births.	Deaths.	Marriages.
1855	2,978,065	93,349	7,357	62,004	19,680	31,345	3·134	2·082	0·660
1856	2,995,771	101,821	8,695	58,529	20,740	43,292	3·395	1·953	0·692
1857	3,012,310	103,415	8,869	61,906	21,369	41,509	3·433	2·055	0·709
1858	3,027,665	104,018	9,354	63,539	19,655	40,479	3·435	2·098	0·649
1859	3,041,812	106,543	9,715	61,714	21,201	44,829	3·502	2·028	0·697
1860	3,054,738	105,629	9,736	68,170	21,225	37,359	3·457	2·231	0·695
1861	3,066,633	107,009	9,929	62,341	20,896	44,668	3·484	2·032	0·681
1862	3,083,989	107,069	10,376	67,195	20,597	39,874	3·471	2·178	0·667
1863	3,101,345	109,341	10,948	71,481	22,234	37,860	3·525	2·305	0·716
1864	3,118,701	112,333	11,197	74,416	22,725	37,917	3·602	2·386	0·728
1865	3,136,057	113,070	11,262	70,891	23,611	42,179	3·605	2·260	0·753
1866	3,153,413	113,667	11,673	71,348	23,688	42,319	3·604	2·263	0·751
1867	3,170,769	114,044	11,148	69,068	22,618	44,976	3·593	2·177	0·710

the price of provisions rose high above those of the previous year; and this, with the lowering of the wages of the manufacturing population, which in many instances led to strikes and locks-out, tended powerfully to restrict marriages, so that they fell 1070, or 5 per cent., below the number of the previous year.

The cattle-plague (Rinderpest), which had been so fatal during the previous year, but was rapidly dying out as that year closed, did not

---

TABLE II.—POPULATION of SCOTLAND, estimated to the middle of each year from the excess of Births over Deaths, deducting Emigrants, and the Per-centage of Births, Deaths, and Marriages to that Population; also the Number of Emigrants, and the Annual Increase or Decrease of Births, Deaths, and Marriages.

prevailed during 1866, also disappeared in 1867, or rather dropped their epidemic form, and fell to their usual status.

Though the cold, stormy, and wintry weather during the first quarter of the year greatly increased the deaths during the first three months, yet the generally fine weather of the remainder of the year told favourably on the public health, so that the annual mortality was below that of previous

years. This was another instance of the fact, often previously noticed in these Reports, that in this country there is no necessary connection between the mortality and the price or scarcity of provisions.

POPULATION.

In a small country like Scotland, where the difficulty of procuring a livelihood at home forces so many to emigrate, and where, from the imperfection of our emigration returns, it is impossible to ascertain, with any approach to correctness, the numbers of those who leave their native country, the estimated population can only be regarded as an approximation. In a large country like England, where the population is not so migratory, the excess of births over deaths, deducting the emigrants, shows very closely the annual increase of population. But to Scotland that mode of estimating the increase does not apply, seeing that between 1851 and 1861 it was found that that mode of calculation would have raised the population to 3,110,299 persons, whereas the ascertained population was only 3,062,294. The population of Scotland is therefore estimated on the assumption that it is increasing at the same ratio as between 1851 and 1861; but as a counterpart to Table I. there is added Table II., showing how the per-centage of births, deaths, and marriages would look, on the supposition that the population was estimated by the excess of births over deaths, deducting the ascertained emigrants, and showing also the annual increase or decrease of the births, deaths, and marriages over the number of these events during the previous year. By our adopted mode of estimation, the population of Scotland would, in the middle of 1867, amount to 3,180,769 persons; of whom 157,139 would inhabit the Insular, 1,794,358 the Mainland-Rural, and 1,219,272 the Town Districts. By the other mode of estimation, the population of Scotland at the middle of the year would amount to 3,228,903 persons. The truth probably lies between the two.

BIRTHS.

114,044 Births were registered in Scotland during the year 1867, being at the high rate of 359 births in every ten thousand persons of the estimated population, or 3·59 per cent. Of these, 4301 were registered in the Insular, 60080 in the Mainland-Rural, and 49663 in the Town Districts,—indicating a proportion in every ten thousand persons of 273 births in the Insular, 334 births in the Mainland-Rural, and 407 births in the Town Districts. As much the same proportions occur year after year, the interesting conclusion is arrived at, that, other things being equal, births, like the deaths, are influenced by density of population, the proportion being highest where the population is most dense, or the masses of people are greatest, and smallest where the population is most widely scattered.

This interesting conclusion is strikingly seen in Table XIII., where the whole of Scotland is divided into four groups of districts:—1st, the Principal Towns, the smallest of which has above 25000 inhabitants; 2d, the Large Towns, having each from 10000 to 25000 inhabitants; 3d, the Smaller Towns, each having from 3000 to 10000 inhabitants; and 4th

the Rural Districts, which embrace the remainder of Scotland. That Table shows that, exactly in proportion to the massing of the people, was the proportion of births. Thus, for every thousand persons in each of these groups in Scotland during the year 1867, there occurred 41 births in the Principal Towns, 39 births in the Large Towns, 36 births in the Small Towns, but only 31 births in the Rural Districts.

But a ten years' summary of the registration in Scotland showed the same fact (Table XV.), seeing that for every thousand persons in each of these groups, 39 births occurred in the Principal Towns, 38 births in the Large Towns, 36 births in the Small Towns, and 31 births in the Rural Districts. This fact establishes the rule, and proves that, other things being equal, it is a law of nature that births are in proportion to the density of the population. This has long been shown to be true of the deaths, but it does not seem to have been recognised that the same law extended to the births. It will be afterwards shown that marriages are subject to the same law.

The same fact may be seen, in a general way, with regard to the several divisions and counties of Scotland. (Table VIII.) Thus, in the

Division, with its 219 persons per square mile, there were 37 births to every thousand persons; and in the South-Western, or most densely peopled Division, with its 441 persons per square mile, there were 41 births per thousand inhabitants.

Of the 114,044 births, 102,896 were legitimate and 11148 illegitimate, indicating that 9·7 per cent. of the births were illegitimate. As usual, the proportion of illegitimate births was lowest in the Insular and highest in the Mainland-Rural Districts, seeing that only 5·3 per cent. of the births were illegitimate in the Insular, 9·5 per cent. in the Town, but 10·2 per cent. in the Mainland-Rural Districts.

The proportion of illegitimate births in the several divisions and counties of Scotland, as shown in Table VIII., generally agrees with that of former returns. Thus the lowest proportion of illegitimates occurred in the counties embraced in the Northern and North-Western Divisions, respectively 5·7 and 6·1 per cent. But the highest proportion was noticed in the North-Eastern and Southern Divisions, respectively 14·5 and 14·7 per cent. of the births. Seven counties had above 12 per cent. of illegitimate births,—viz. Elgin, 12·7 per cent.; Banff and Dumfries, each 14·5; Aberdeen and Kincardine, each 14·9; Kirkcudbright, 15·7; and Wigtown, 17·9 per cent. The two counties which are the great centres of our commercial, mining, and manufacturing interests, viz. Renfrew and Lanark, respectively showed only 7·3 and 8·6 per cent. of illegitimate births.

Of the children born during the year, 58517 were boys and 55527 girls, showing that 105·4 boys were born for every 100 girls. This pro-

portion is remarkably constant from year to year, and is very nearly the normal proportion of the sexes at birth over Europe, with the singular exception of England, which appears only to have the average proportion of 104·4 boys to every 100 girls at birth.

The greatest daily number of births occurred during the months of April, May, and June—as in former years; the smallest number during the months of September, November, and December.

During the year, 1365 twin births, 12 triplet births, and one quadruple birth occurred, showing that one in every 83 mothers bare twins, and one in every 8665 bare triplets.

MARRIAGES.

22618 Marriages were registered in Scotland during the year 1867, being in the proportion of 71 marriages in every ten thousand persons of the estimated population. This was 1070 marriages fewer than during the previous year, being a falling off to the extent of 5 per cent. The number and proportion of marriages are thus again seen to be the surest modes of guessing at the general prosperity of our commercial and manufacturing industry. When these are prosperous, marriages increase, as they did during the four prosperous years, 1863, 1864, 1865, and 1866; but when trade gets depressed, and wages are obliged to be lowered, and even many are thrown out of work, as in 1867, the marriages decrease.

It has been always pointed out in these Reports, that the proportion of marriages was much higher in the Town than in the Rural Districts. Thus, while in every ten thousand persons in each group of districts, only 52 marriages occurred in the Insular, and 59 marriages in the Mainland-Rural Districts, no fewer than 90 marriages occurred in the Town Districts. But when we analyze these districts more closely, and divide them into four groups according to density of population, as is done in Tables XII. and XIII., it is found that the proportion of marriages in each group is, like that of the births and deaths, exactly proportioned to the density of population, being most numerous where the greatest mass of human beings are congregated together, and fewest where the population is most scattered. Thus, for every ten thousand persons in each of the groups, during the year 1867, there occurred 93 marriages in the Principal Towns, 79 marriages in the

Large Towns, 68 marriages in the Small Towns, but only 56 marriages in the Rural Districts.

The year 1867 was not an exceptional year in this respect, for when we look to the number and proportion of marriages in Scotland for the ten years 1856–1865, as given in Tables XIV. and XV., it is seen that the same law holds good, viz., that marriages occur in proportion to the density of the population, other things being equal. Thus, during these ten years, for every ten thousand persons in each group, there occurred 89 marriages in the Principal Towns, 79 marriages in the Large Towns, 69 marriages in the Small Towns, but only 56 marriages in the Rural Districts—proportions (excepting in the Principal Towns) nearly identical with those above given for the year 1867.

The proportion of legitimate children born to each marriage was, as usual, much higher in Scotland than in England during 1867. Thus, to the 22618 marriages in Scotland there were born 102,896 legitimate children,

1867	44·51	23·65	14·36	9·02	2·15	5·84	0·28	0·19

giving a proportion of 4·55 children for every marriage, or 455 children for every 100 marriages. But in England, during the same year, there were 179,154 marriages, and to these there were born 723,163 legitimate children, being 4·02 children to every marriage, or 402 children to every 100 marriages. This either indicates that the Scottish female is much more prolific than her sister in England, or, if it be assumed that the fecundity is the same, it indicates that a very large number of even legitimate births escapes registration in England.

Of the 22618 marriages registered in Scotland during the year, 10066 were contracted according to the rites of the Established Church, 5347 according to those of the Free Church, 3247 according to those of the United Presbyterian Church, 2039 according to those of the Romish Church, 488 according to those of the Episcopal Church, 1323 according to the varying rites of the smaller religious denominations; in 65 cases the religious denomination was omitted to be stated; and in 43 cases the marriage was what is termed irregular, that is, without a religious ceremony, and without publication of banns.

These facts indicate that 44·51 per cent. of the marriages in Scotland were celebrated according to the rites of the Established Church of Scotland, 23·65 per cent. according to the rites of the Free Church, 14·36 per cent. according to the rites of the United Presbyterian Church, 9·02 per cent. according to the rites of the Romish Church, 2·15 per cent. according to the rites of the Episcopal Church, 5·84 according to the rites of the smaller religious denominations; while in 0·28 per cent. the religious denomination had been omitted to be stated; and in 0·19 per cent. (that is to say, 19 in every ten thousand marriages) the marriage was irregular, that is to say, was contracted without the previous proclamation of banns, and without a religious ceremony.

Of the 22618 men who married, the ages of 22594 were ascertained, and of these, 1532, or 6·77 per cent. were minors, or under 21 years of age. Of the 22618 women who married, the ages of 22586 were ascer-

tained, and of these, 4611, or 20·41 per cent., were minors, or under 21 years of age. (Tables XIX. and XX.)

It is impossible to ascertain correctly the proportion of minors who marry in England. The Marriage Registers are kept by the clergy, and so imperfectly, that in 1867, 33 per cent. of the marriages had no definite age of the parties entered in the registers. Thus, of the 179,154 marriages entered in the registers, the age of the parties was only given in 119,173 instances; and of these, 11081 men, being 9·29 per cent. of the men, and 29567 women, being 24·81 per cent. of the women, were minors, or were under 21 years of age. Hence it would appear that a considerably higher proportion of minors marry in England than in Scotland.

Some might be inclined to attribute the higher proportion of minor marriages in England to the fact, that the general marriage-rate in England is much higher than in Scotland. But what at once proves that this will not account for the circumstance is the ascertained fact, that though the annual marriage-rate in the Mainland-Rural Districts of Scotland is one-third lower than in the Town Districts, the relative proportion of minor marriages is nearly the same in each. Thus, during the year

be considered as identical. (Table XXIII.) The higher marriage-rate in England is therefore not the cause why minors in that country marry in higher proportions than in Scotland.

Climate is the more likely cause; for the statistics of Norway and Sweden prove, that in these still colder climates than Scotland, the period of marriage is greatly retarded beyond what it is in Scotland; and the climate of Scotland, as compared with that of England, has no doubt, though to a less degree, the same effect in retarding the period of puberty, and, of course, that of marriage. For some interesting statistics bearing on this point, and showing the ages at which mothers gave birth to children in Scotland and in Sweden, reference may be had to our Eighth Detailed Annual Report, p. xiv.

The same fact is brought out by comparing the number of men and women who married under 25 years of age in England and in Scotland during the year 1867. In Scotland, 40·63 per cent. of the men, and 57·47 per cent. of the women who married, were under 25 years of age. In England, during the same year, it appears, from the returns, that 51 per cent. of the men, and 63 per cent. of the women who married, were under 25 years of age. The English, therefore, marry at an earlier age than the Scotch; and that this retardation of the period of marriage in Scotland is rather to be ascribed to the effect of the colder climate than to the lower marriage-rate, is almost proved by the fact, that the Town and Mainland-Rural Districts of Scotland, though they differ in their marriages by a full third—of course, a much greater difference than between England and Scotland—yet the relative proportion of men and women under 25 years of age who marry annually is absolutely identical. Thus, in the Mainland-Rural Districts, 41·33 per cent. of the men, and 57·83 per cent. of the women who married in 1867, were under 25 years; while in the Town Districts, where the general marriage-rate is one-third higher, 41·43 per cent. of the men, and 58·24 per cent. of the women who married, were under 25 years of age. Difference of marriage-rate in the two districts caused no difference in the ages at which men and women married in the Town and Rural Districts of Scotland. Whereas, had the earlier age at which men and women contract marriages in England been caused by the higher marriage-rate, the Town Districts of Scotland, which have a much

higher marriage-rate than that of all England, ought to have had a higher proportion of men and women marrying under 25 years of age than ever occurs in England.

Every event in vital statistics, like the phenomena of nature around us, seems to be under fixed laws. Thus, not only is the proportion of marriages very much the same from year to year, but the very constituent parts of these marriages are nearly identical. Thus, if Tables XX. and XXI. be consulted, it will be seen that even the proportion of men and women at different ages who contract marriages is nearly identical year after year. Thus, of the women who married during the twelve years 1855–1866, 12·65 per cent. were under 20 years of age; 45·87 per cent. were from 20 to 25 years; 24·03 per cent. were from 25 to 30 years; 8·69 per cent. were from 30 to 35 years; and 4·43 per cent. were from 35 to 40 years. The proportions for the year 1867 were nearly the same. Thus, of the women who married during that year, 11·82 per cent. were under 20 years of age; 45·63 per cent. were between 20 and 25 years; 24·70 per cent. were between 25 and 30 years; 8·72 per cent. were from 30 to 35 years; and 4·55 per cent. were from 35 to 40 years of age.

Of these 22618 marriages, the conjugal or civil condition of the parties previous to their marriage was ascertained in 22409 cases. Of these 22409 marriages, 19067 were between bachelors and spinsters; 578 were between bachelors and widows; 2075 were between widowers and spinsters; and 689 between widowers and widows. (Tables XXII. and XXIII.) These numbers indicate that 85·09 per cent. of the marriages were between bachelors and spinsters; 2·58 per cent. between bachelors and widows; 9·26 per cent. between widowers and spinsters; and 3·07 per cent. between widowers and widows—proportions which closely correspond with those of former years.

The last two columns of Table XXVI. show the proportion of widowers and widows who re-married in 1867 in Scotland, its divisions, and counties. By that Table it appears that, in Scotland, 12·33 per cent. of the men who married were widowers, and 5·65 per cent. of the women who married were widows. As these proportions are pretty constant from year to year, they indicate that more than twice as many widowers marry

more than twice as numerous as widowers are to the male population. Accordingly, we find that at the census of 1861, 8 per cent. of the female population above 15 years of age were widows, while only 3 per cent. of the male population above 15 years of age were widowers.

The last four columns of Table XXV. show the relative proportion of marriages between persons in different conjugal conditions, during the thirteen years 1855–1867. By these it will be seen that the relative proportion of marriages between bachelors and spinsters, bachelors and widows, etc., varies very little from year to year, and repeats itself with as unfailing regularity as the ages at which the parties marry.

During 1867 the state of elementary education among the people, in so far as such is indicated by the ability to write their names in the marriage registers, was much the same as in former years. (Tables XXIV., XXV., and XXVI.) Thus, during the year 1867, of the 22618 men who married, 20224 signed their names in writing, while 2394, being unable to write, signed by mark. Of the 22618 women who married during the year, 17931 signed their names in writing, while 4687, being unable to write, signed by mark. These numbers indicate that 89·41 per cent. of the men, and 79·27 per cent. of the women, were able to sign their names in writing; while 10·59 per cent. of the men, and 20·73 per cent. of the women, not being able to write, were obliged to sign by mark.

In England, during the same year, only 78·9 per cent. of the men, and 71·2 per cent. of the women, who married, were able to sign their names in writing; while 21·1 per cent. of the men, and 28·8 per cent. of the women, not being able to write, had to append their mark. By this test, therefore, elementary education is in a much more advanced stage in Scotland than in England.

Ross and Cromarty, Inverness, and Sutherland, are the counties in Scotland which exhibit the highest proportion of persons unable to write. After these come the counties which contain the largest number of persons of Irish descent, the number unable to write being closely proportioned to the number of Irish in the population. This is perhaps the principal cause of the difference between Edinburgh and Glasgow in the proportion of men and women able to write their names. Thus, in Edinburgh, 95·80 per cent. of the men, and 91·96 per cent. of the women who married during the year, were able to write their names in the registers; but in Glasgow, only 83·36 per cent. of the men, and 65·91 per cent. of the women, could write their names. To state it otherwise, only 4·20 per cent. of the men, and 8·04 per cent. of the women in Edinburgh, not being able to write, had to append their mark to the registers; while in Glasgow, 16·64 per cent. of the men, and 34·09 per cent. of the women, being unable to write, were obliged to sign by mark.

DEATHS.

69068 Deaths were registered in Scotland during the year 1867, being at the rate of 21·77 deaths in every thousand of the estimated population. The mean death-rate of the ten previous years was 21·83 deaths in every thousand persons, so that the mortality was somewhat below the average.

In England, during the same year, the deaths were in the proportion of 21·98 deaths in every thousand persons; and were thus above the Scottish rate, but below their own mean of the ten previous years, which was at the

rate of 22·54 deaths annually in every thousand persons of the estimated population.

The Insular and Mainland-Rural Districts had, as usual, a much lower mortality than that of the Town Districts. Thus, 2583 deaths occurred in the Insular, 33190 deaths in the Mainland-Rural, and 33295 deaths in the Town Districts; which indicates a mortality of 16·43 deaths in every thousand persons in the Insular, 18·49 deaths in the Mainland-Rural, and 27·30 deaths in the Town Districts.

It is instructive, however, to refer to Tables XII. and XIII., which show the number and proportion of deaths in the Town and Rural Districts of Scotland when divided into four groups according to the density of the population. By these Tables it will be seen that, like the births and marriages, the mortality is exactly proportioned to the density of the population, or rather to the size of the mass of human beings congregated together, being highest where the greatest number of persons were congregated together, lowest in the Rural Districts where the population is most scattered. Thus, in every thousand persons in each of the groups, 27·99 died during the year in the Principal Towns, 24·91 died in the Large Towns, 21·89 died in the Small Towns, but only 17·00 died in the Rural Districts.

But the instructive point to note is, that the varying death-rate is steady in each group of districts, and is the normal condition of things; for if we

take a ten years' summary of the deaths in each of these four groups, as is shown in Tables XIV. and XV., we shall find that, from 1856 to 1865, for every thousand persons living in each group, 28·25 deaths occurred annually in the Principal Towns, 24·57 deaths in the Large Towns, 21·24 deaths in the Small Towns, and only 16·95 deaths in the Rural Districts.

It would appear, however, that nature does nothing without a compensation, though this fact seems hitherto to have been entirely overlooked. Thus, it has already been shown, when speaking of the births and marriages, that if the Principal Towns have the highest proportion of deaths, they have also the highest proportion of births and of marriages, while each of the other groups have their births and marriages in exact proportion to their deaths. In fact, the now ascertained facts, when looked at from a philosophical point of view, would seem to lead to the conclusion, that it was a law of nature that the rapidity of the circulation of life in each country was dependent on the density of the population; and that if the lamp of human life burned out most quickly where the population was most dense, ample provision was made for keeping up the supply of life, seeing that, in proportion to the density of the population, the ratio of both marriages and births was correspondingly increased.

When from groups of districts, arranged according to the varying size of the towns, we descend to the individual towns themselves, it is found that the existence of local and often temporary causes tends to obscure the general law above indicated. Thus, a virulent epidemic, a more insalubrious site, exceptional overcrowding, or a strike, with its privations and diseases, etc., will often cause a smaller town to exhibit a higher mortality than a larger one. This is the reason why no confidence can be placed on conclusions drawn from limited data, which are often exceptional. Still it is interesting year by year to note the varying mortality which prevails in the principal towns of a country. Thus, for every thousand persons living in each of the Eight Principal Towns of Scotland during the year 1867, there

land (Tables XXXIII. and XXXIV.) proves that a residence in towns proves equally destructive to life at every age. Thus, if we look at the male mortality in the Mainland-Rural and Town Districts, it appears that in every thousand living during the first year of life, 204·35 died during the year in the Town, but only 128·90 in the Rural Districts. Under 5 years of age

And while at the ages of 80 to 90 years, 248·51 died in every thousand males in the town, only 186·51 died in the Rural Districts.

The series of Tables XXXVI. to XLII. inclusive, shows the mortality in ages and sexes in each of the Eight Principal Towns of Scotland, and generally agrees with those of former years.

Causes of Death.

Of the 69068 deaths registered in Scotland during the year 1867, the cause of death was accurately recorded in 65947 instances. In the remaining 3121 cases, being 4½ per cent. of the whole, the causes of death were stated in such indefinite terms that they could not be referred to any particular class of diseases, while in a small number the disease of which the person died was not named. In mentioning the proportion in which the several diseases proved fatal to the population, a correction is made for the non-specified causes of death.

The Zymotic or epidemic and contagious class of diseases cut off 13256 persons in Scotland during the year 1867, of whom 6530 were males and 6726 females. That class of diseases, therefore, caused a proportion of 438

deaths in every hundred thousand persons, or constituted 20·10 per cent. of the mortality during the year. This was a proportion greatly below the average; seeing that, during the ten years 1855 to 1864, the zymotic class of diseases caused the annual proportion of 518 deaths in every hundred thousand persons, or constituted 24·26 per cent. of the ascertained deaths.

As usual, males were cut off by these diseases in a much higher ratio than females; for while 458 males died from the zymotic diseases in every hundred thousand males, only 419 females died out of an equal number of females.

The zymotic diseases constituted 14·81 per cent. of the ascertained deaths in the Insular, 19·34 per cent. in the Mainland-Rural, and 21·18 per cent. in the Town Districts. As compared with the population, however, these diseases caused 243 deaths in every hundred thousand persons in the Insular, 344 deaths in the Mainland-Rural, but 578 deaths in a like population in the Town Districts.

Of the Eight Principal Towns, the mortality from the zymotic class of diseases was heaviest in Leith, and lightest in Perth and Aberdeen. Thus, in every ten thousand persons in each town, 25·6 died from the zymotic diseases during the year in Perth, 36·7 in Aberdeen, 57·6 in Edinburgh, 58·7 in Greenock, 63·1 in Glasgow, 63·4 in Dundee, 67·3 in Paisley, and 70·3 in Leith. If we compare the proportion of zymotic deaths to the total deaths, the towns arrange themselves in nearly the same order,—Perth and

Aberdeen with the smallest proportional mortality, and Leith the highest. Thus, in Perth, 12·16 per cent. of the deaths were caused by the zymotic class of diseases; in Aberdeen, 15·14 per cent.; in Greenock, 19·63; in Edinburgh, 21·21; in Dundee, 21·27; in Glasgow, 21·93; in Paisley, 23·92; and in Leith, 25·38 per cent.

During the year 1867, Small-pox caused only 100 deaths in Scotland—the lowest mortality from that disease ever registered in Scotland, so far as known, during the present century up to that year. Table XLVII. shows the deaths from Small-pox during each year since the Registration Act came into operation, and it will be seen that it has waves of increase and decrease. But as the mortality has been steadily declining during the years 1865, 1866, and 1867, during which periods the Vaccination Act has been

1867	Per-centage	96·48	0·64	0·22	0·02	0·15	2·49	100·00

in full operation, it seems fair to assume that the low mortality from Small-pox may fairly be ascribed to the successful working of that Act.

Tables XLVIII. and XLIX. show how perfectly the Vaccination Act has worked in Scotland. These Tables show that, of the children whose births were registered in 1867, and who survived till vaccinated, only 2·49 per cent. remained unaccounted for, and they were chiefly the children of parents who were vagrants, or who had removed from the district, and were thus lost sight of before the vaccination of the child could be enforced.

Fever was the most fatal of the zymotic diseases during 1867, proving fatal to 3387 persons, and thus constituting 5·14 per cent. of the deaths in Scotland, or causing 111 deaths in every hundred thousand persons. Fever was proportionally more fatal to males than females; for though the absolute number of male deaths from fever was only 1669, while the female deaths numbered 1727, females so preponderate in the population that, in every hundred thousand of each sex, 118 males died, but only 108 females. Of the 3387 deaths from fever, 1745 were caused by Typhus or Spotted Fever, 1378 by Enteric or Typhoid Fever, 40 by Relapsing Fever, 105 by Simple Continued Fever, and 119 by Infantile Fever, which is a mere variety of Enteric Fever. During the same year, therefore, the whole known varieties of continued fever were present; and it only requires one or other fever to take the lead, to constitute the epidemic one of Typhus, or of Enteric, or of Relapsing Fever.

It is worthy of note, however, that in ordinary years Typhus or Spotted Fever is most common in the Towns, while Enteric (Gastric or Typhoid) Fever is most prevalent in the Rural Districts. Thus, it will be seen by Table L., that while 60 per cent. of the fever deaths in the Towns were caused by Typhus Fever, only 40 per cent. were caused by Typhus in the Mainland-Rural Districts. But, on the other hand, while 50 per cent. of the fever deaths in the Mainland-Rural Districts were caused by Enteric Fever, only 32 per cent. of the deaths were caused by that form of fever in the Town Districts.

Fever had a very different mortality in each of the Eight Principal Towns. Thus, 2·68 per cent. of the deaths were caused by fever in Perth, 2·94 per cent. in Dundee, 4·25 per cent. in Aberdeen, 4·76 per cent. in Edinburgh, 6·02 per cent. in Glasgow, 6·42 per cent. in Greenock, 7·03 per cent. in Leith, and 7·07 per cent. in Paisley.

Scarlatina was the next most fatal of the epidemic diseases, having cut off 2253 persons, of whom 1154 were males and 1099 females, being in the

TABLE L.—DEATHS from FEVER in 1867.

FEVERS.	MAINLAND-RURAL DISTRICTS.		TOWN DISTRICTS.	
	Fever Deaths.	Proportion to Total Fever Deaths.	Fever Deaths.	Proportion to Total Fever Deaths.
Typhus . . .	648	40·86	1045	60·51
Enteric . . .	798	50·31	563	32·60
Relapsing . . .	25	1·58	15	0·87
Simple Continued .	62	3·91	39	2·26
Infantile . . .	53	3·34	65	3·76
ALL FEVERS . .	1586	100·00	1727	100·00

proportion of 81 male deaths, but only 68 female deaths in every hundred thousand of each sex. The relative per-centage of deaths from Scarlet Fever was almost identical in the Town and Rural Districts, seeing that 3·45 per cent. of the deaths were caused by that disease in the Rural Districts, and 3·47 per cent. in the Town Districts.

The Eight Principal Towns suffered very differently from Scarlatina during 1867, the mortality therefrom being lowest in Perth and Aberdeen and highest in Leith; Perth having only 0·35 per cent. of its deaths caused by Scarlatina, but Leith 5·51 of its deaths.

Measles and Hooping-cough were less than usually prevalent and fatal during 1867, the former causing only 1341 deaths, or 2 per cent. of the deaths over Scotland; the latter causing 1728 deaths, or 2·6 per cent. of the mortality.

The mortality from Diarrhœa, Dysentery, and Cholera, was little above the average in 1867; Diarrhœa having caused 1481 deaths, Dysentery 255, and Cholera 142. The Cholera, which during the previous year had assumed the epidemic type, and cut off 1270 persons, did not put on the epidemic form during 1867. Still, the tendency to it was strong, and little might have developed its fatal epidemic virulence. Even as it was, the deaths from Cholera were three times greater than the average.

Diphtheria caused only 610 deaths in Scotland during 1867, and, as in former years, was more prevalent and fatal in the Rural than in the Town Districts.

Of the other diseases belonging to the zymotic class, Croup caused 925 deaths, Thrush 30, Influenza 210, Purpura 49, Ague 1, Worms 27, Metria 163, Rheumatic Fever 125, Erysipelas 225, Pyæmia 34, Syphilis 156 (of which 124 congenital), and Noma 14.

As throwing light on the causes of infantile mortality, and as showing that the younger the child the more liable it is to be cut off by certain diseases, notice may be taken of the proportions in which the epidemic and a few other diseases proved fatal to children under two years of age, as compared with the total deaths from each disease at all ages. 63 per cent. of the persons who died from Hooping-cough were under two years of age. 60½ per cent. of the persons who died from Measles, 61 per cent. of those who died from Diarrhœa, 61 per cent. of those who died from Hydrocephalus, 60 per cent. of those who died from Enteritis, 83 per cent. of those who died from Convulsions, 48½ per cent. of those who died from Croup, 48 per cent. of those who died from Small-pox, 28 per cent. of those who died from Diphtheria, and 21½ per cent. of those who died from Scarlatina, were under two years of age. Of course, almost all the deaths from Teething were under two years. These proportions show that the above are the diseases to which the very young are especially prone, and every effort ought to be made to prevent children being attacked with these diseases till a few years have rolled over them, seeing that, as a general rule, they are less and less liable to fall victims to the disease the older they are.

The diseases of uncertain seat caused 2408 deaths, and thus constituted 3·65 per cent. of the mortality, or caused 80 deaths in every hundred thousand of the population. Cancer was the most fatal of the diseases under this class, causing the death of 1288 persons, of whom 416 were males and 872 females. Of the other diseases belonging to this class, Dropsy (whose cause or exact seat was not stated) caused 711 deaths, Hæmorrhage (not otherwise defined) 63, Abscess 163, Ulcer 39, Fistula 12, Mortification 117, and Gout 15.

The Tubercular class of diseases caused 11668 deaths, of which 5690

were males and 5978 females. This indicates an annual proportion of 399 male and 373 female deaths in every hundred thousand of each sex, showing, as in former years, that males died from these diseases in higher proportion than females. As compared with the population, the proportion of persons dying from these complaints was nearly twice as great in the Town as in the Rural Districts, seeing that, for every hundred thousand persons in each district, 289 died from tubercular diseases in the Mainland-Rural Districts, but 520 in the Town Districts. Compared with the deaths, 16·5 per cent. of the deaths were caused by the tubercular class of diseases in the Mainland-Rural Districts, but 19 per cent. in the Town Districts.

Phthisis, or Consumption, is not only the most fatal of the diseases under the tubercular class, but it is the individual disease which cuts off a larger number of our race than any other. In 1867 it caused the death of 8248 persons, of whom 3810 were males and 4438 females. It thus cut off in the proportion of 268 males and 277 females in every hundred thousand persons of each sex. During 1867, therefore, as in former years, females died in a higher proportion than males from Phthisis. This disease is very much more fatal to the inhabitants of the Town than to those residing in the Rural Districts. Thus it caused 209 deaths in the Mainland-Rural, but 358 deaths in the Town Districts, in every hundred thousand persons in each.

Of the other diseases belonging to the tubercular class, Scrofula caused 620 deaths, Tabes Mesenterica 945, and Hydrocephalus 1855. This last disease is much more fatal to males than to females, seeing it caused the deaths of 1028 males, but only of 827 females, being in the proportion of 72 males, but only 51 females in every hundred thousand of each sex.

Diseases of the Brain caused 5458 deaths, of which 2922 were males and 2536 females, indicating a proportion of 205 male, but only 158 female deaths in every hundred thousand persons of each sex.

Diseases of the Heart and Blood-vessels caused 3380 deaths, of which 1702 were males and 1678 females, being in the proportion of 119 male and 104 female deaths in every hundred thousand of each sex.

Inflammatory Affections of the Respiratory Organs caused 10019 deaths, of which 5152 were males and 4867 females, indicating a proportion of 361 male but only 303 female deaths from these diseases, in every hundred thousand inhabitants—the males again showing a great preponderance of deaths, contrary to what was noticed in Consumption.

Of the individual diseases belonging to this class, Bronchitis was the most fatal, and caused 6777 deaths. Pneumonia caused 2070 deaths, Asthma 530, Laryngitis 123, Pleurisy 203, and Diseases of the Lungs (not otherwise specified) 316 deaths.

It is worthy of note, as being a characteristic of these inflammatory affections of the respiratory organs, that they are always twice as fatal to the inhabitants of the Town as they are to those of the Rural Districts. Thus, in every hundred thousand persons, these diseases of the lungs caused 158 deaths in the Insular, and 225 deaths in the Mainland-Rural, but 486 deaths in the Town Districts of Scotland, during the year 1867. A ten years' summary of the deaths shows the same fact; for, from 1855 to 1864, in every hundred thousand persons, 150 died from these lung diseases in the Insular, 204 in the Mainland-Rural, but 407 in the Town Districts. There is no other class of diseases where the Town mortality is constantly double that of the Rural Districts; and the fact that it is

diseases of the lungs which are so especially fatal to our race in the towns, seems clearly to indicate the especial cause of the high mortality in towns, and what it is which sanitary legislation should attempt to remedy —viz. give a purer air to breathe inside and outside the dwellings.

Diseases of the Organs of Digestion caused 4907 deaths, 2519 being males and 2388 females. This indicates that, in every hundred thousand persons of each sex, 177 male deaths and 149 female deaths occurred from these diseases. Of the diseases belonging to this class, Teething caused 962 deaths, Quinsey 56, Gastritis 155, Enteritis 933, Peritonitis 273, Ascites 82, Ulceration of Intestines 187, Hernia 92, Ileus 297, Intussusception 30, Stricture of Intestines 32, indefinite Disease of Stomach 773, Disease of Pancreas 1, Hepatitis 143, Jaundice 161, other Diseases of Liver 700, and Disease of Spleen 30 deaths.

Kidney and Urinary Diseases caused 1013 deaths, of which 659 were males and 354 females, indicating that 46 males, but only 22 females, died from these complaints in every hundred thousand of each sex. Of these diseases, Nephritis caused 87 deaths, Nephria 239, Ischuria 57, Diabetes 81, Stone 65, Cystitis 170, Stricture of Urethra 16, and undefined Disease of the Kidneys 290 deaths. Eight deaths were ascribed to Addison's Disease—affection of the supra-renal capsules.

Diseases of the Generative Organs caused 486 deaths, confined to females alone. Of these, 321 were ascribed to one or other of the diseases attending childbirth, to which must be added the 163 deaths from Metria, or childbed fever, in order to give us the total number of deaths from childbirth during the year 1867. This gives 484 deaths among the 112,651 mothers who bare children during the year, indicating one death in childbearing in every 233 mothers, or 43 deaths in every ten thousand mothers—a small proportion, which would be much reduced had the mothers proper medical attendance, as is proved by the fact that the relative mortality in childbirth, unlike that of all diseases, was greatest in the Insular Districts, where there is almost no medical attendance to be had, and least in the Town Districts, where no one need want medical aid who wishes to have it. Thus, for every ten thousand female deaths in each group of districts, the proportion of 233 died from childbirth (including Metria) in the Insular Districts, 152 in the Mainland Districts, but only 124 in the Town Districts.

Diseases of the Organs of Locomotion caused 391 deaths, of which 211 were males and 180 females. Of these, 78 deaths were ascribed to Diseases of the Bones, 140 to Diseases of the Joints, and 173 to Rheumatism.

75 deaths were attributed to Diseases of the Skin and subcutaneous cellular tissue. Of these, 18 were caused by Carbuncle, 15 by Phlegmon, and 42 by Diseases of the Skin.

Malformation caused 207 deaths; Premature Birth and Debility at Birth, caused 3367 deaths; Atrophy, 521 deaths; Age, without apparent disease, 6449 deaths; while 146 deaths were sudden, the immediate cause not having been ascertained.

2196 deaths were ascribed to violent causes, being in the proportion of 72 deaths in every hundred thousand persons—being the exact average of the ten years 1855–1864,—indeed, no deaths are so regular, year after year, as those which are caused not by natural but by violent causes. Of these deaths, 905 were attributed to fractures and contusions, 467 to drowning, 249 to burns and scalds, 139 to suffocation (92 of which were from overlying), 25 to gunshot wounds, 32 to cuts and stabs, 63 to hanging, 76 to intemperance, 1 to privation, 82 to want of breast milk, 1 to neglect, 29 to

exposure to cold, 54 to poison, 1 to poisoned wound, and 72 to other violent causes not included in the above.

Of the above violent deaths, 145 were suicides; of which 62 were by hanging, 25 by cut-throat, 20 by drowning, 8 by gunshot, 7 by precipitation from a height, 17 by poison (15 of which were by opium or some of its preparations), while in six the form of suicide was not stated.

Table LI. shows the eighteen most fatal diseases in Scotland and England, arranged according to the order of their fatality, and giving the proportions in which they prove fatal to the population. From that Table it will be seen that the different diseases have very different death-rates in the two countries during the same year, though they are inhabited by the same races, and are usually considered to be subject to very nearly the same meteorological influences.

From that Table it would appear that Consumption and Bronchitis were more prevalent and fatal in Scotland during 1867 than in England, but that Pneumonia was more fatal in England. A very much larger proportion of persons seem to die from Old Age in Scotland than England; while in England the deaths from Atrophy, Debility, and Premature Birth greatly exceed the proportion in Scotland. But one of the most striking peculiarities is the difference in the two countries in the proportion of deaths from Convulsions. This is a complaint, as all are aware, to which very young children are especially liable. But Scotland only lost from Convulsions in the proportion of 28 out of every hundred thousand persons of the population, while England lost 123 from Convulsions out of a like population. The essentially different manner in which infants are fed in the two countries is quite sufficient to account for the difference in the mortality. It does not arise from a greater proportion of infants being drugged with preparations of opium in the one country than in the other, for that vice is equally prevalent in the manufacturing districts of both countries; and a comparison of the mortality from Convulsions in the truly agricultural

Table LI.—The Eighteen most fatal Diseases in Scotland and England in 1867, arranged in the order and proportion of their fatality.

Scotland.		England.	
Diseases.	Proportion of Deaths to 100,000 living.	Diseases.	Proportion of Deaths to 100,000 living.
Phthisis	272	Phthisis	259
Bronchitis	224	Debility, Atrophy, Premature Birth	194
Old Age	213	Bronchitis	190
Atrophy, Debility, Premature Birth	128	Old Age	135
Heart, etc., Diseases	112	Convulsions	123
Fever (Typhus, etc.)	111	Heart, etc., Diseases	107
Scarlet Fever	74	Pneumonia	99
Pneumonia	68	Diarrhœa	93
Hydrocephalus	61	Fever (Typhus, etc.)	79
Hooping-cough	57	Scarlet Fever	58
Paralysis	55	Hooping-cough	55
Diarrhœa	49	Paralysis	50
Measles	44	Apoplexy	49
Cancer	42	Cancer	40

Tabes Mesenterica	31	Tabes Mesenterica	32

counties of England with those of Scotland, shows that in these, where no opiates are abused, the difference in the mortality is proportionally as great as within the manufacturing counties of Scotland and of England. The English, as a general rule, begin to stuff the infant with bread-pap and other more solid foods almost from birth. The Scotch, as a general rule, give no solid food till the first teeth are cut, and till nature thus shows that she has prepared the suckling for digesting more solid food than that which it drew from its mother's breasts.

Fever and Scarlatina were more prevalent and fatal in Scotland than in England during 1867; while Hooping-cough was also somewhat more fatal in Scotland. Liver diseases, however, were more fatal in England; while Cancer was slightly more fatal in Scotland.

Weather, and its Influence on the Health.

It may be regarded as an ascertained fact, that the weather is the great regulator of the mortality in Scotland, and that two or three months of a very low temperature, or a month or two of very high temperature, do more to raise the mortality than the existence of any epidemics. The high temperature in this country seems directly to induce bowel complaints, of which the most fatal are Diarrhœa, Dysentery, and Cholera; while extremely cold weather increases the prevalence and fatality of all diseases, whether they be epidemic or sporadic. It is of great importance, therefore, that attention should be paid to the character of the weather.

It may be stated, in a general way, that the health of the population was generally good during the year 1867, and the mortality below its average. During the first quarter of the year, however, the death-rate was considerably above the average; but this arose solely from the severity of the wintry weather, which increased the deaths from all diseases, and did not arise from the special prevalence or fatality of any particular epidemic. During the three remaining quarters of the year the mortality, on the other hand, was below its average, and none of the diseases to which we apply the term epidemic was more prevalent than usual.

During the greater part of January keen frosts prevailed, the ground was covered with snow, and the falls of snow were occasionally so heavy as to arrest traffic. This kind of weather came on suddenly on the 30th December 1866, on the wind changing from south-west to north-east. The temperature fell very low during January, the lowest temperature noted being —6°, or 38 degrees below the freezing-point of water. The frost and snow continued uninterrupted from the last day of December 1866 till the evening of the 23d January 1867, when the balmy south-west winds regained the mastery, a rapid thaw set in, and the snow disappeared so rapidly, that by the 25th most of the hills were clear of snow. The mild weather which came with these south-westerly breezes continued till the close of the month. The cold weather which prevailed during the first three weeks of January depressed the mean temperature of the month to 31°·8, and thus caused it to be 5°·3 below the mean of previous years; but the mean temperature of the frosty period was about 28°.

During the previous month (December 1866) the mean temperature had been 40°·6, and 205 persons had died daily in Scotland. But the reduction of the mean temperature during January to 31°·8, increased the daily deaths to 238. In other words, the fall of the mean monthly temperature by 9 degrees had increased the monthly deaths over Scotland by 1016.

February was an unusually mild month, with the wind almost constantly from the south-west. The mean temperature was therefore unusually high, viz. 41°·4, or 3°·8 above the mean of former years. On the 24th, however, the wind veered to the north and north-east, bringing with it frost and occasional falls of snow. The high mean temperature of February, as compared with that of the previous month, had a marked effect in reducing the deaths, for under the milder temperature only 210 persons died daily over Scotland. In other words, allowing for difference in the length of the month, a rise of 10°·4 of mean temperature caused a monthly saving of 777 lives in Scotland.

The keen east and north-east winds which prevailed during almost the whole of March rendered it a cold ungenial month, notwithstanding the much greater warmth of the day temperatures, under the potent influence of the sun's rays. The mean temperature of March, therefore, fell to 36°·2, and thus presented the anomaly of being 5°·2 below the temperature of February, and 3°·3 below the mean of former years. The mortality kept exact pace with the reduction of temperature, for the daily deaths, which numbered 210 during February, rose to 217 daily during March. In other words, February, with its high mean temperature of 41°·4, registered only 5876 deaths, while March, with its much lower mean temperature of 36°·2, registered 6736 deaths.

April was a cold ungenial month, with a more clouded sky, less sunshine, and more rain than usual. The mean temperature was, however, somewhat higher than usual, viz. 45°·3; but this was caused by the nights being less cold, in consequence of the clouded sky arresting the radiation of caloric from the surface of the earth. The range of temperature was consequently 2°·4 less than the average for the month. Under the milder temperature the deaths fell to 208 daily.

May was also a cold ungenial month, particularly during its latter half. During the first and second weeks south-west winds prevailed, and during their continuance vegetation advanced rapidly. During the latter half, however, of the month, cold easterly winds prevailed, and in all the higher parts of the country, frost occurred almost every morning, blighting vegetation. During the month, the weather in Scotland was often the very opposite of that in England. Thus, during the second week of the month, while the mean temperature in the Eight Principal Towns of Scotland was 51°·8, that of London and the English towns ranged from 60° to 63°, the usual difference due to difference of latitude being two degrees only. The mean temperature of May being 47°·5, or two degrees higher than that of April, the deaths over Scotland fell to 194 daily.

June had a lower mean temperature than the average of former years, viz. 54°·3, with a greater amount of cloud, less sunshine, smaller daily range of temperature, and less rain, yet with a greater amount of humidity in the atmosphere. The close heat, from the great amount of humidity in the atmosphere, was for some days very oppressive, particularly on the 11th; yet such was the hazy state of the atmosphere, that on that day the highest degree of temperature noted in the self-registering thermometer was 75°. In many parts of the country, frost was observed on the morning of the 21st. The more genial mean temperature of the month, however, allowed the deaths in Scotland to fall to 174 daily.

July was warm and genial till the 13th, when a rainy period set in, the rain continuing to fall almost constantly till the 24th. In many places on the 21st, from 1½ to 2 inches of rain fell in 24 hours. This rainy period was followed by a cold one, which continued till the close of the month; and the cold east winds which then prevailed so reduced the temperature,

that the mean temperature of the month was only 54°·8, or two degrees below the mean of former years.

August was the warmest month of the year, having a mean temperature of 57°·4; but there was a great deficiency of sunshine, from the sky being more clouded than usual.

September differed little in its weather from its ordinary character in former years, and its mean temperature of 53°·4 was four degrees below that of August.

As is usual when the mean temperature does not rise above 58°, the mortality attained its minimum, or lowest point, in September, when only 157 persons died daily in Scotland.

During the remaining months of the year the weather did not deviate materially from its ordinary character, and the year closed without the mean temperature of any week having been so low as 32°. Indeed, the coldest week was the first week of December, when the mean temperature was 35°·5, but the last week of the year had a mean temperature of 41°·9.

Smart frost occurred on the 3d and 4th of October, mowing down the garden flowers and arresting vegetation. Cold, bleak, misty days followed till the 18th, when the mild enjoyable weather known as the Indian Summer commenced, and continued till the close of the month. Under its influence the mean temperature rose from 45° to 50°, but the mean temperature of the month was 46°·4.

November entered with cold north-west winds, but, on the whole, the winds were less keen than usual. The air was clearer, there was less cloud, less mist or fog, less rain, less humidity of atmosphere, and more sunshine than usual, rendering the month less unpleasant than ordinary Novembers.

December was, on the whole, a mild month, with strong westerly and south-westerly breezes, occasionally rising into hurricanes.

With the fall of temperature the mortality increased, so that October, with its mean temperature of 46°·4, had 169 deaths daily in Scotland; November, with its mean temperature of 41°·6, had 174 deaths daily; while December, with its mean temperature of 38°·8, had its deaths increased to 195 daily.

Table LII. shows the chief points of the meteorology of Scotland for every month of the year 1867. By that Table it appears, that the mean barometric pressure for the year, corrected to 32° Fahr. and to the sea-level, was 29·872 inches. The mean temperature was 45°·7, being more than half of a degree lower than that of the previous year. The highest temperature noted at any station in the protected thermometer was 85°, and the lowest —6°. The mean of the day temperatures was 51°·5, and the mean of the night temperatures 40°·0, giving a mean daily range of 11°·5. The highest temperature in the sun, noted in the black bulb thermometer exposed to its direct rays, was 135°, or 6°·4 less than that of the previous year; and the greatest degree of cold during the night, noted in the black bulb thermometer exposed on the grass, was —9°, being 5° lower than that of the previous year. Rain, sleet, or snow fell on 182 days, with a mean depth of water of 38·52 inches, being 2·89 inches of water less than during the previous year. The sun shone during 1518 hours in the course of the year, and the mean humidity of the air was 86°. Easterly winds, on the average, blew 100 days during the year, or six days more than during the previous year; and westerly winds blew 174 days, or six days less than during the previous year.

But though Table LII. and the above statement show the powerful effect of weather on the mortality, when traced month by month, it is

instructive to know that the deleterious effects arising from depression of temperature may be traced from week to week, and even from day to day. For instance, if a very severe night occurs during the winter or spring months, when the temperature becomes lowered to zero, or thereabouts, it has been again and again noticed by the registrars, that that night proves fatal to most of the very aged persons in the parish, and otherwise increases the general mortality. In consequence of publishing weekly the number of births, deaths, and marriages, the temperature, and the fall of rain, in each of the Eight Principal Towns of Scotland, we have the means of tracing the effect of the weekly variations of temperature on the public health, and

TABLE LII.—Meteorology of Scotland for the Year 1867, deduced from Observations made at 55 Stations of the Meteorological Society of Scotland, the particulars for each of the Stations having been published in the Quarterly Reports of the Registrar-General for 1867; also the Number of Births, Deaths, and Marriages registered during each Month of the Year 1867.

Table LIII. gives a summary of the results for every week of the year 1867.

In studying that Table it is necessary to observe, that although a sudden fall of temperature manifests immediately its deleterious effects on the human frame, a day or two frequently elapses before the person's death is registered. Consequently, if the fall of temperature occurs at the beginning of a week, the deaths registered during the week, in general, accurately express the effect of the fall of temperature; but if the fall occurs at the end of a week, we must look to the deaths registered during the following week to see the full effects of that depression of temperature. Thus, during the week ending 5th January, the lowest temperature occurred during the

last day of the week, and consequently, though the mean temperature of the second week was nearly five degrees higher than that of the first week, the deaths really produced by the intense cold on the 5th of January were registered during the second week, so that, while only 602 deaths were registered during the first week, they numbered 641 during the second week. In like manner, the coldest week of the year was that ending January 19, its mean temperature having been 27°·9; but as the intense cold continued to its very close, it was the following week which registered the greatest number of deaths, viz. 705, the deaths registered during the previous week having been 597. A week of mild mean temperature (for winter months), viz. 43°·5, occurred on the week ending 2d February, and the deaths fell to 562, having on the last week of January been 705. The continuance of comparatively mild weather during the second, third, and fourth weeks of February, during the last of which the mean temperature was 45°·7, allowed the deaths to fall to 509. Four cold weeks occurred after this in March, the mean temperature slowly and regularly descending till it reached the mean of 33°·1 and 33°·9,—the greatest cold being on the 21st, when the lowest temperature was 17°·0; the consequence was that the deaths gradually increased, till they numbered 616 on the week ending 30th March. After this milder weather set in, and the mean temperature rose, varying during April from 43° to 47°. With this increase of temperature the deaths decreased, so that on the last week of April they numbered only 481.

A careful study of that Table will show that the closest possible connection exists between the temperature and the mortality, and that in this country it is cold which has the most baneful effects on health. In those countries where the summer heats are great, the hot months are the most fatal to the human race, because the heat encourages or excites attacks of fevers and various bowel complaints, as Diarrhœa, Dysentery, and Cholera. Even in Scotland the tendency of the mortality to increase under the influence of a warm temperature is noticed; but the increased deaths from that cause are so few that they do not in general materially increase the deaths, nor invalidate the general statement, that in Scotland our most deadly enemy is cold. Thus, during one week alone, viz. that ending 17th August, the mean temperature was 61°·1, having been 57°·5 the week previous, and 57°·9 the week following. During that hot week the deaths rose to 441, having been 409 the previous, and 405 the following week. The above examples may suffice to prove the general truth of the facts brought under consideration, and the Table is there to speak for itself.

Table LIV. is drawn with the view of showing the influence of the weather, but especially of the mean monthly temperature, on different diseases and classes of disease in the Eight Principal Towns of Scotland. This Table is worthy of attentive study, because it not only tends to confirm all that has been advanced with regard to the influence of temperature on the general mortality, but also proves that the same agent has an equally powerful influence on each disease and class of diseases. Nay more, it proves that those diseases which we call epidemics are subject to the very same law of temperature in Scotland, as are those diseases which we style sporadic, such as Bronchitis, Pneumonia, Enteritis, etc. Thus, the zymotic (epidemic and contagious) class of diseases, which caused in the Eight Towns 398 deaths in June, caused 480 deaths in December, and 518 deaths in January, the coldest month; Scarlatina, which caused only 50 deaths in July, caused 159 in December; Typhus, which caused 90 deaths in June, caused 140 deaths in January; Diseases of the Respiratory Organs, which

caused 192 deaths in August, caused 538 deaths in December, and 712 in January; Brain Diseases, which caused 157 deaths in August, caused 235 deaths in December; and Old Age, which caused 89 deaths in August, caused 118 in December, and 177 in January, the coldest month.

In countries where the mass of the population is dependent for their sustenance on the crops which they raise, and where they have little or no external trade, it is the crops which are the great regulators of the mortality, after the weather. For if the crops partially or wholly fail, the price of the food rises so high as to be beyond the power of purchasing by the lower classes. In such countries, therefore, the amount of sickness and death almost invariably rises and falls with the price of the provisions. When provisions are abundant, and consequently cheap, the amount of sickness is small and the death-rate low; but a failure of the crops almost invariably brings a high amount of sickness, and the death-rate becomes excessive.

In a country like this, where the great mass of the population is dependent on trade and commerce for their livelihood, and where there exists the means of procuring from other countries any kinds of food which may be deficient in this, we have not been able to trace any connection between the mortality and the price of provisions, as Table LV. will show. The prices of wheat and potatoes which are quoted are those of the official returns for England and Wales, as they are more to be depended on for correctness than the Scottish returns. Here we see that, while the price of wheat, the staple of life, steadily diminished in price from 69s. per quarter in 1856, to 44s. per quarter in 1858, the deaths in Scotland as steadily increased from 52529 in 1856 to 63539 in 1858. Again, the price of wheat was the same in 1861 and 1862, viz. 55s. per quarter; but the deaths, which only numbered 62341 in 1861, had increased in 1862 to 69195. The price of wheat and of all provisions regularly diminished from 1862 to 1864, so that wheat, which sold at 55s. the quarter in 1862, fell to 44s. 8d. the quarter in 1863, and to 40s. 2d. in 1864; while potatoes, which brought 137s. the ton in 1862, fell to 100s. in 1863, and to 75s. the ton in 1864. If a plentiful supply of provisions, therefore, and cheapness in price, could of themselves exert appreciable influence on the mortality, there ought to have been a marked diminution of the deaths during these years. But, on the other hand, the mortality largely increased from year to year; for while only 67195 deaths occurred in 1862, the year of high prices, they increased to 71481 deaths in 1863, and to 74416 deaths in 1864.

Table LV.—Deaths in Scotland compared with the Average Price of Wheat and Potatoes during the Thirteen Years 1855-1867.

Year.	Average Price of Wheat per quarter.	Deaths in Scotland.	Average Price of Potatoes per ton.
	s. *d.*		*s.* *d.*
1855	74 8	62,004	100 6
1856	69 2	52,529	85 6
1857	56 5	61,906	120 8
1858	44 3	63,539	120 0
1859	43 10	61,714	94 0
1860	53 3	68,170	132 6
1861	55 4	62,341	124 0
1862	55 5	67,195	137 0
1863	44 8	71,481	100 0
1864	40 2	74,416	75 0
1865	41 9	70,891	85 5
1866	49 11	71,348	89 6
1867	64 5	69,068	138 0

The same want of connection between the prices of provisions and the mortality was noticed during the years 1864 and 1865, and again during the years 1866 and 1867. Thus, in 1866, the price of wheat was only 49s. 11d. per quarter, while potatoes sold for 89s. 6d. per ton; but in 1867 the average price of wheat had risen to the almost famine price of 64s. 5d. per quarter, and potatoes to 138s. per ton. Notwithstanding of this, the cheap year had the large number of 71348 deaths in Scotland, while the year of high prices allowed the deaths to fall to 69068. In other words, 2280 fewer deaths occurred in Scotland during the year when provisions were at fabulously high prices, than during the previous year, when provisions were very low in price.

I have the honour to be,

Sir,

Your most obedient Servant,

JAMES STARK.

General Registry Office of Births, etc.,
Edinburgh, *December* 7, 1869.

* In all the Counties marked thus *, the number of Acres is given from actual survey by the Ordnance Staff; and these measurements were procured from the Ordnance Survey Office, through the kindness of Col. Sir Henry James. The measurements of the other Counties, with the exception of Shetland and Orkney, were taken from Major Dawson's estimate for the Census of 1851. In that estimate he included as land all the channels between the islands in Shetland and Orkney. These channels are excluded in the estimate given in the above Table.

CONSTITUTION OF THE COMPOUND DISTRICTS.

No.	District.	Component Parts (Parishes).
13	Birsay	Part of Harray & Birsay.
14	Deerness	Part of St Andrews.
15	Eday & Pharay	Part of Stronsay & Eday.
22	North Ronaldshay	Part of Cross & Burness.
26	Sanday	Lady, and part of Cross & Burness.
86*b*	Carloway	Parts of Lochs and Uig.
87	Lochs	Parts of Lochs and Uig.
112	Kilmuir	(1) Part of Kilmuir, (2) Rest of Kilmuir and part of Snizort.
135	Elgin	Elgin, and parts of New Spynie and St Andrews-Lhanbryde.
147	Banff	Banff, and part of Gamrie.
152	Enzie	Parts of Bellie and Rathven.
155*b*	Glenrinnes	Part of Aberlour and Mortlach.
167	Seafield	Parts of Cullen and Rathven.
222*b*	Millbrex	Parts of Fyvie and Monquhitter.
227*a*	New Machar	New Machar, and part of Udny.
227*b*	New Pitsligo	Parts of Aberdour, New Deer, Strichen, and Tyrie.
237*b*	Savoch	Parts of Ellon, New Deer, Old Deer, and Tarves.
240	Strathdon	Strathdon, and part of Tarland.
272	Arbroath	Arbroath, and part of St Vigeans.
282	Dundee	Dundee, and part of Liff, Benvie, and Invergowrie.
312	Montrose	Montrose, and part of Dun.
324	Aberfeldy	Parts of Dull, Fortingall, Kenmore, Logierait, and Weem.
331	Balquhidder	Balquhidder, and part of Comrie.
333	Blackford	Blackford, and part of Ardoch.
344	Dowally	Part of Dunkeld & Dowally.
348	Dunblane	Dunblane, and part of Ardoch.
349	Dunkeld	Parts of Caputh and of Dunkeld & Dowally.
355*a*	Fortingall	Parts of Fortingall and Weem.
355*b*	Foss	Part of Dull.
360	Kenmore	Parts of Kenmore and Weem.
361	Killin	Parts of Kenmore, Killin, and Weem.
367	Kinloch-Rannoch	Parts of Fortingall and Logierait. [Redgorton.
375	Logiealmond	Parts of Fowlis-Wester, Little Dunkeld, Methven, Monzie, and
379	Meigle	Meigle, and part of Coupar-Angus.
386*a*	Muthill	Muthill, and part of Ardoch. [& Kinloch, and Rattray.
386*b*	Persie	Parts of Alyth, Bendochy, Blairgowrie, Caputh, Kirkmichael, Lethendy
387	Perth	Perth, and parts of Kinnoull, Scone, and Tibbermore.
394*b*	Strathfillan	Part of Killin.
394*c*	Tenandry	Parts of Blair-Athol, Dull, and Moulin.
423	Dunbog	Dunbog, and parts of Abdie and Flisk.
442	Kirkcaldy	Kirkcaldy, and parts of Abbotshall and Kinghorn.
490	Stirling	Stirling, and part of St Ninians.
493	Bonhill	Bonhill, and part of Dumbarton.
496	Dumbarton	Parts of Cardross and Dumbarton.
506	Ballachulish, &c.	Part of Kilmalie.
509	Cumlodden	Parts of Glassary and Inveraray.
515	Kilbrandon & Kilchattan	Kilbrandon & Kilchattan, and part of Jura.
526	Lochgilphead	Parts of Glassary and South Knapdale. [Knapdale.
535	Tarbert	Parts of Kilcalmonell & Kilberry, of Saddell & Skipness, and of South
536	Bowmore (or Killarrow)	Part of Killarrow & Kilmeny.
538	Iona	Part of Kilfinichen & Kilvickeon.
542	Kilfinichen & Kilvickeon	Parts of Kilfinichen & Kilvickeon, and of Torosay.
543	Kilmeny	Part of Killarrow & Kilmeny.
545	Kinlochspelvie	Part of Torosay.
546	Oa	Part of Kildalton.
547	Portnahaven	Part of Kilchoman.
548	Salen	Parts of Kilninian & Kilmore, and of Torosay.
549	Tobermory	Part of Kilninian & Kilmore.
556	Lochranza	Parts of Kilbride and of Kilmory.
557	North Bute	North Bute, and part of Rothesay.
559	Abbey	(1) Parts of Abbey and Renfrew, (2 & 3) Rest of Abbey.
578	Ayr	Ayr, and parts of Newton-upon-Ayr, and of St Quivox.
595	Irvine	Irvine, and part of Dundonald.
612	St Quivox, &c.	Parts of Newton-upon-Ayr, and St Quivox.
626*b*	Calderhead	Parts of Cambusnethan and Shotts.
644	Glasgow	City of Glasgow, including Gorbals and parts of Barony and Govan.
670	Queensferry	Queensferry, and part of Dalmeny.
684	Portobello	Parts of Duddingstone and South Leith.
685	Edinburgh	City of Edinburgh, including Canongate and parts of St Cuthberts, Duddingstone, Liberton, and South Leith.
690	Kirknewton & East Calder	Kirknewton & East Calder, and part of Kirkliston.
692	Leith	(1) Parts of Cramond, North Leith, and St Cuthberts; (2) Parts of North Leith, St Cuthberts, and South Leith.
787*b*	Edgerston	Parts of Jedburgh, Oxnam, and Southdean.
813*b*	Brydekirk	Parts of Annan, Cummertrees, and Hoddam.
853*b*	Wanlockhead	Part of Sanquhar.
857*b*	Bargrennan	Parts of Minnigaff (Kirkcudbright), and of Penninghame (Wigton).
862	Corsockbridge	Parts of Balmaclellan, Kirkpatrick-Durham, and Parton.
864	Dalbeattie	Part of Urr.
899	Stranraer	Stranraer, and parts of Inch and Leswalt.

INDEX TO THE DISTRICTS.

*The Figures refer to the Numbers of the Districts in the preceding Tables of Births, Deaths, and Marriages (pages 2 to 23) these being numbered consecutively from 1 to 901.**

Abbey, . 559
Abbey St Bathans, . 726
Abbotshall, 399
Abdie, . 400
Abercorn, . 661
Aberdalgie, 323
Aberdeen, . 168
Aberdour (Aberdeen), . 169
Aberdour (Fife), 401
Aberfeldy, . 324
Aberfoyle, . 325
Aberlady, . 702
Aberlemno, 269
Aberlour, . 145
Abernethy, 326
Abernethy and Kincardine, 124
Abernyte, . 327
Aboyne, . 170
Aharacle, . 505
Airdrie, . 651
Airlie, . 270
Airth, . 469
Alford, . 171
Alloa, . 465
Alness, . 57
Alva (Stirling), 470
Alvah (Banff), 146
Alves, . 125
Alvie, . 90

Eaglesham, 561
Earlsferry, 436
Earlston, . 734
Eassie & Nevay, 286
East Kilbride, 643

* The actual number of Districts is 1016—many Parishes and Burghs having been divided into two or more Districts for the purposes of Registration. Thus Edinburgh and Glasgow, to each of which only a single number is assigned in the Tables, consist of 5 and 10 Districts respectively. In forming the alphabetical arrangement, the principle adopted has been to place *compound* names in the order in which they are pronounced.

Eastwood, . 562
Eccles, . 737

APPENDIX.

Letter to the Registrar-General on the Causes of Death in Ireland in 1865, from William M. Burke, Esq., F.C.P.I., ... 95–98

Index of Superintendent Registrars' Districts, and of Registrars' Districts, . . . 99–105

REPORT

TO

His Excellency JOHN POYNTZ, EARL SPENCER, K.G., &c., &c.,
Lord Lieutenant-General and General Governor of Ireland.

MAY IT PLEASE YOUR EXCELLENCY,—

As directed by the provisions of the 26 Vic., cap. 11, sec. 49, the 26 & 27 Vic., cap. 90, sec. 16, and the 7 & 8 Vic., cap. 81, sec. 56, I have the honour to transmit to your Excellency, in order that the same may be laid before Parliament, General Abstracts of the Births, Deaths, and Marriages registered in Ireland during the year 1865.

A General Abstract of the number of Births, Deaths, and Marriages, registered in the year 1865, was presented to Parliament in the Session of 1866. The Report now submitted contains detailed Tables of the ages and condition of persons married, of Births, distinguishing legitimate from illegitimate; and of Deaths, and their causes.

The Acts for the Registration of Births and Deaths, and Roman Catholic Marriages, came into operation on the 1st of January, 1864, but that for the Registration of Protestant Marriages of all denominations has been in force since the 1st of April, 1845.

For the purposes of Registration, the country has been divided into 163 Superintendent Registrars' Districts—co-extensive with the Poor Law Unions—and into 770 Registrars' Districts, which, with a few exceptions, are of equal extent, with the Dispensary Districts formed under the Medical Charities Act. Of the Registrars, 713 are Medical Officers of Dispensary Districts. In twenty-one instances a Medical Officer is Registrar for two Districts, the remaining (36) have been appointed by the Boards of Guardians.

GENERAL SUMMARY.

The *estimated* population in the middle of 1865 was 5,641,086; the persons whose marriages were registered, amounted to 61,604; the number of marriages being 30,802; children born alive whose births were registered, amounted to 144,970; and the number of deaths registered was 93,154. The emigrants from Ireland during the year 1865 amounted to 101,497. In the previous year—1864—there were *registered* 27,406 marriages, 136,414 births, and 93,144 deaths; the number of emigrants was 114,169.

MARRIAGES.

30,802 marriages were registered during 1865; being in the proportion of ·546 marriages to every 100 persons, or of 1 marriage to every 183 persons, of the *estimated* population. The ratio in England was 1 in 113, or ·884 per cent., and in Scotland 1 in 133 or ·753 per cent. of the estimated population.

1,027 men and 5,129 women contracted marriage before they had attained their twenty-first year. The proportion of males married under age was 3·33; of females, 16·65 per cent. The proportions in England and Wales in 1865 were—males, 6·69, and females, 20·08 per cent. In Scotland the proportions were 7·16 males and 21·26 per cent. females.

Of widowers, 3,321, and of widows, 1,763 were re-married; the proportion being 10·78 per cent. of widowers, and 5·72 per cent. of widows, to the total marriages. The like proportions in England and Wales were 13·93 widowers, and 9·24 per cent. widows. In Scotland the proportions were, widowers, 11·50, and widows, 5·26 per cent.

According to the provisions of the Registration Acts, every registry of a marriage is required to be signed by the parties married, two witnesses, and the officiating clergyman. A test of the elementary education of the persons contracting marriage is thus afforded by comparing the number who write their names in the registers, with the number who make a mark. Of 61,604 persons married in 1865, 28,359 (12,445 men and 15,914 women) signed the registers with marks; being in the proportion of 46·0 per cent., or 1 in every 2·48 of the males, and 1 in every 1·94 of the females married.

The like rates in England and Wales for the same year were 1 in 4·45 males, and 1 in 3·21 females; and in Scotland 1 in 8·75 males and 1 in 4·50 females.

The marriage registers contain a column in which the age of each of the parties married is inserted; but as the law only requires it to be stated whether the parties are "of full age" or "minors," the precise age at marriage is not always entered in the registers. In 1865 the exact ages of both parties were given in 13,910 instances. Of these 12,540 were bachelors, and 13,196 spinsters; 1,370 were widowers, and 714 widows. The largest number of wives was married between 21 and 30—the number being 8,480, or more than one-half of the whole number whose ages are recorded. The largest number of husbands—8,526—is also found to have been married between 21 and 30 years of age.

Three hundred and seventy bachelors were married to widows, both of whose ages at the time of marriage are recorded. Of these, 186 of the widows and 176 of the bachelors married between 25 and 35 years of age. Of 1,026 widowers who married spinsters, 483 of the latter were between 25 and 35 years of age; whilst the largest number of the widowers on their re-marriages ranged chiefly between 30 and 45.

Of widowers and widows married, whose ages at the time of marriage are stated, there were 344 couples. Of these the largest number of widows appears to have been between 40 and 50, and of widowers between 45 and 55. Fifteen widowers and two widows were married when they were above 70 years old.

The proportion per cent. of marriages to the estimated population, and of persons married who wrote their names in the registers; also of minors,

widowers, and widows, are given in the following table, for the several registration divisions:—

TABLE I.—*The Proportional Number of Marriages in the Eight Divisions of Ireland during the years* 1864 *and* 1865, *of Persons who Signed their Names, of Persons not of Full Age, and of Re-marriages.*

The extent and position of each of these divisions are specified at page xxxiii.

Of the total number of marriages registered (30,802) 21,782 were celebrated by Roman Catholic clergymen, and entered in the register books by the Registrars in accordance with the 26th and 27th Vic., cap. 90; and 9,020 marriages were of the various Protestant persuasions. Of the latter marriages 5,064 were in churches and chapels of the Established Church, 2,709 in Presbyterian Meeting-houses, 165 in "Registered Buildings," 1,062 in the Registrars' offices, 15 according to the usages of the Society of Friends, and 5 marriages were of members of the Jewish persuasion. Of the entire number of marriages in 1865 there were contracted in the quarter ending the last day of March, 12,308; of June, 5,659; of September, 5,854; of December, 6,981.

The following table gives a statement showing in continuation of the return in my report for 1864, the number of marriages solemnized in Ireland under the Marriages Act of 1844, distinguishing the mode of celebration:—

TABLE II.—*The Number of Marriages registered under 7 & 8 Vic., c. 81, in each Year, from 1st April, 1845, to 31st December, 1865, and the Mode in which the Marriages were solemnized.*

There is not any return made to me of the places of worship belonging to Roman Catholics in which marriages are celebrated; but under the provisions of the 7th & 8th Vic., cap. 81, I am enabled to state respecting other religious persuasions, that there were 1,454 Churches and Chapels of the Established Church, 574 registered Presbyterian Meeting-houses, and 192 Registered Buildings belonging to various denominations, in which marriages might lawfully be solemnized, on the 31st December, 1865. During the year 1865 there was an increase of three in the number of such places in the Established Church; of one in the Presbyterian Church, and of four in other religious communities. The "Registered Buildings" belong to the following denominations:—

Denominations.	Number of Places of Worship.
Wesleyan Methodists,	99
Reformed Presbyterians,	33
Independents,	21
Baptists,	12
Seceders,	9
United Presbyterians,	5
Moravians or United Brethren,	5
Methodists New Connexion,	5
Church Methodists,	1
Covenanters,	1
Evangelical Union,	1
Total,	192

* The 7 & 8 Vic., c. 81, came into operation 1st April, 1845.

The following Table shows by Divisions and Registrars' Districts the number of places of worship in which marriages (under the 7 & 8 Vic., cap. 81) may be solemnized in each District or Union, distinguishing the religious denominations:—

During the year 1865 there were issued by the Registrars, 736 Licences for Marriage in Registered Buildings, and in the Registrars' offices.

The number of Marriage Licences issued by the licensing Ministers of the several Presbyterian bodies is given in the following summary :—

Presbytery or Synod.	Number of Licensing Ministers on 31st December, 1865.	Number of Registered Meeting-houses on 31st December, 1865.	Number of Licences issued.
1. General Assembly of the Presbyterian Church in Ireland,	114	533	2,604
2. Remonstrant Synod of Ulster,	7	22	57
3. Presbytery of Antrim,	4	10	29
4. United Presbytery or Synod of Munster,	4	4	2
5. Northern Presbytery of Antrim,	1	5	12
Total,	130	574	2,704

BIRTHS.

The births registered in Ireland during 1865, amounted to 144,970. Of these, 74,386 were males, and 70,584 females, being in the proportion of 105·4 boys to every 100 girls. In England, in the same year, the number of males to 100 females whose births were registered was 104·0; and in Scotland 106·1.

The rate per cent. of births to the *estimated* population was 2·570. In England the rate was 3·564, and in Scotland 3·605.

There were 5,370 illegitimate births, of which 2,757 were those of males, and 2,613 females; the proportion to the total number of births being 3·7 in every 100. The rate in England was 6·2, and in Scotland 9·9 per cent. The highest rates, 6·4 and 5·2, of illegitimate children in every 100 born, occurred in the North-Eastern and South-Eastern Divisions respectively.

The following table shows the proportion of legitimate and illegitimate births *registered* in each of the eight Divisions in 1864 and 1865.

TABLE IV.—*The Per-centage of Legitimate and Illegitimate Births registered in Ireland during the years* 1864 *and* 1865, *by Divisions.*

Divisions.	Proportion per cent. of Legitimate Births.		Proportion per cent. of Illegitimate Births.	
	1864	1865	1864	1865
North-Eastern,	93·8	93·6	6·2	6·4
North-Western,	96·4	96·8	3·6	3·2
Eastern,	96·6	96·9	3·4	3·1
North Midland,	97·3	97·5	2·7	2·5
South Midland,	95·7	96·4	4·3	3·6
Western,	98·1	98·3	1·9	1·7
South-Eastern,	94·9	94·8	5·1	5·2
South-Western,	97·6	97·5	2·4	2·5

38,320 births were registered during the quarter ended 31st March; 39,109 in that ended 30th June; 34,045 during that ended 30th September; and 33,496 in that ended 31st December.

DEATHS.

The deaths registered in 1865 amounted to 93,154, of which 46,246 were males, and 46,908 females, being in the proportion of 1·651 per cent. of the *estimated* population, or in the ratio of 1 *registered* death to every 61 persons. The proportion in England for the same year was 2·339 per cent., or 1 in 43; and in Scotland 2·260 per cent., or 1 in 44.

The following table shows the per-centage of mortality at different ages :—

TABLE V.—*The Mortality per Cent. at each Age-period, according to the Registration of Deaths in Ireland, during the Years* 1864 *and* 1865, *by Sexes.*

Sexes.		Ages.											
		0—	5—	10—	15—	25—	35—	45—	55—	65—	75—	85—	95 and upwards.
Males,	1864	28·65	4·23	2·32	7·57	6·19	5·78	7·76	11·51	12·30	10·11	2·97	·61
	1865	29·13	4·51	2·32	7·58	6·38	5·88	7·76	10·76	12·44	9·62	3·04	·58
Females,	1864	25·20	4·28	2·37	6·90	6·55	6·03	7·80	11·81	13·74	11·23	3·36	·73
	1865	25·89	4·62	2·41	7·07	6·64	6·13	7·84	11·24	13·62	10·53	3·25	·76
Males and Females,	1864	26·92	4·25	2·34	7·24	6·37	5·91	7·78	11·66	13·02	10·68	3·16	·67
	1865	27·50	4·57	2·37	7·32	6·51	6·00	7·80	11·00	13·03	10·08	3·15	·67

Of the persons whose deaths were registered during the year 27·50 in every 100 were children under 5 years old—of which 29·13 per cent. were males, and 25·89 per cent. females. 13·24 per cent. of the men, and 14·54 per cent. of the women, whose deaths were registered had passed their 75th year. 58 of the males and 76 of the females in every 10,000 were stated in the returns to have been over 95 years of age.

EMIGRATION.

During the year 1865 the number of emigrants who left the ports of Ireland amounted to 101,497; of these 55,214 were males and 46,283 females. Of the whole number 20,524, or 20·2 per cent., were from Leinster; 37,426, or 36·9 per cent., from Munster; 22,301, or 22·0 per cent. from Ulster; and 12,477, or 12·3 per cent., from Connaught: 8,769 persons, or 8·6 per cent., did not state the county or province to which they belonged.

METEOROLOGY.

The following meteorological observations, taken at the Ordnance Survey office,* Phœnix Park, Dublin, during the year 1865, have been furnished by Captain Wilkinson, R.E., by direction of the Superintendent of the Ordnance Survey.

The barometer was highest during the year 1865, at 9.30, A.M., on the 15th of December, when it stood at 30·827,—the wind blowing from the S.W.; it was lowest on the 14th of January, at the same hour, with the wind from the W.N.W.,—when it was 28·540 inches.

The highest temperature in the air during the year was 83·9° on the 22nd of June, and the lowest 20·4° on the 20th of January. Rain or snow fell on 178 days, being nearly six months of wet days in the year; the greatest rain-fall in 24 hours was 1·355 inches on the 10th of August, with the wind from the S.W. The prevailing wind was from the W., from which point it blew for 99 days; from the S.W. it came for 75 days; from E., 60; S., 26; S.E., 25; N., 25; N.E., 23; and N.W., 18; and it was calm on 14 days at 9·30, A.M. The total pressure of the W. wind was

* Latitude, 53° 21′ 44″·65 North. Longitude, 6° 21′ 6″·35 West. Height above the sea, 158·8 feet.

147·58 lbs., being an average of 1·49 lbs. to the square foot. The strongest wind blew from the S.W. on the 30th December, when the pressure was 36 lbs. per square foot.

I beg here to repeat the observations made in my Report to your Excellency for 1864, with respect to the working of the Acts for the Registration of Births, Deaths, and Marriages in Ireland, as I regret to state the numbers of these events registered in 1865 do not show any satisfactory increase compared with the previous year :—

"In several instances prosecutions have been resorted to with some advantage; but notwithstanding the exertions made to induce a general compliance with the law throughout the country, numerous cases of neglect to register births and deaths have been reported to me by the District Registrars, but frequently at too late a period after their occurrence to allow of the parties being proceeded against at the Petty Sessions.

"I regret to add that the registration of marriages under the 26th & 27th Vic., cap. 90, is not at all satisfactory in some Districts, owing to the Clergy who have celebrated the marriages having declined to sign the necessary certificates.

"The marriages solemnized under the provisions of the 7th & 8th Vic., cap. 81, which came into operation in 1845, are, I believe, all registered.

"The following are the ratios of Births, Deaths, and Marriages to population in different countries compared with the ratio in Ireland in 1864 [and 1865] :—

Countries.	Ratio to Population.		
	Births.	Deaths.	Marriages.
IRELAND [in 1864], ...	1 in 42	1 in 61	1 in 207
IRELAND [in 1865], ...	[1 in 39]	[1 in 61]	[1 in 183]
England, ...	1 „ 28	1 „ 42	1 „ 116
Scotland, ...	1 „ 28	1 „ 42	1 „ 137
Sweden, ...	1 „ 30	1 „ 50	1 „ 145
Prussia (Old Provinces), . . .	1 „ 24	1 „ 38	1 „ 116
Hanover, ...	1 „ 30	1 „ 44	1 „ 124
Wurtemburg, ...	1 „ 23	1 „ 31	1 „ —
Hanse Towns: Bremen, . . .	1 „ 28	1 „ 37	1 „ 105
Holland, ...	1 „ 30	1 „ 42	1 „ 127
France, ...	1 „ 38	1 „ 44	1 „ 127
Spain, ...	1 „ 26	1 „ 32	1 „ 127
Austria (exclusive of Hungary), . .	1 „ 25	1 „ 31	1 „ 121

"It will be seen from the foregoing figures, compiled from the Statistical Tables published by the Board of Trade, how incomplete was Registration in Ireland in 1864, and comparing the number of Births, Deaths, and Marriages recorded in that year with those since annually registered, I regret to state that there appears but little improvement in the subsequent years :—

		1864.	1865.	1866.	1867.	1868.
Registered.	Births, . .	136,414	144,970	146,237	144,318	146,108
	Deaths, . .	93,144	93,154	93,598	93,911	86,803
	Marriages, . .	27,406	30,802	30,151	29,796	27,753"

Following this Report are summaries of the Quarterly Reports issued in 1865, and the Appendix contains a letter addressed to me by Dr. Burke, the Superintendent of Medical Statistics, respecting the causes of death—to which I beg to refer.

I have the honour to be
Your Excellency's
Very faithful servant,

William Donnelly,
Registrar-General.

General Register Office,
Dublin, 31st August, 1869.

SUMMARY OF THE QUARTERLY REPORTS, 1865.

Quarterly Reports.

First Quarter—January, February, March.

First Quarter.

Marriages.—There were 12,308 marriages *registered* in Ireland during the quarter ending 31st March, 1865, being equal to an annual ratio of 1 marriage to every 115, or ·873 per cent. of the estimated population; of these marriages, 10,172 were between Roman Catholics (26 and 27 Vic., cap. 90), and 2,136 between Protestants (7 and 8 Vic., cap. 81).

The number of marriages *registered* in the corresponding quarter of 1864 was 9,602—7,385 Roman Catholic and 2,217 Protestant—the return for the first quarter of the year 1865 showing an increase of 2,787 in the former, and a decrease of 81 in the latter. The increase in the number of Roman Catholic marriages is probably owing to the fact that the Act 26 and 27 Vic., cap. 90, only came into operation on the 1st January, 1864, and that some marriages were not *registered* during the first quarter of that year.

Births.—The births *registered* during the quarter ending 31st of March amounted to 38,320, representing an annual ratio of 1 birth in every 36·8 of the estimated population. The number *registered* during the corresponding quarter of the year 1864 was 30,179, thus showing an increase of 8,141 between the two periods. A portion of this increase must be attributed to the fact of some of the births which occurred at the close of the first quarter of 1864 (the first year of Registration), not having been *registered* until the beginning of the second quarter (21 days being allowed to elapse after a birth before the person responsible for registering it becomes liable to a fine of twenty shillings).

Notwithstanding the increase in the number of births between the first quarter of 1864 and the corresponding quarter of 1865, still, from the ratio which the number of births *registered* in some of the Superintendent Registrars' districts bears to the population, it is evident that, in very many instances, the provisions of the Registration Act were not complied with.

Deaths.—The deaths *registered* during the first three months of 1865 amounted to 29,259, or an annual mortality of 1 in 48·2 of the estimated population. The number *registered* during the corresponding quarter of 1864 was 28,043.

Emigration.—The number of persons leaving the ports of Ireland, who stated to the Enumerators "that it was *not their intention to return*," amounted, during the first quarter of 1865, to 15,848—8,654 males and 7,194 females—being 11,777, or 43 per cent. less than the number who left during the corresponding period of 1864.

Decrease of the Population.—The births *registered* during the quarter, as already stated, amounted to 38,320; the deaths to 29,259, and the number of emigrants to 15,848; it would, therefore, appear that the population of Ireland decreased during the three months by 6,787, being the excess of the deaths over the births added to the number of emigrants.

PRICES OF PROVISIONS AND PAUPERISM.

The price, in Dublin, of the 4 lb. loaf during the thirteen weeks of the quarter was 5½*d.* It was 6*d.* during the corresponding period of 1864.

The average price of oatmeal, at the Dublin Corn Exchange, was 11*s.* 9*d.* per cwt. during the quarter, ranging from 11*s.* 2*d.* in the seventh week to 12*s.* 6*d.* in the last week; the average price in the corresponding period of 1864 was 11*s.* per cwt., varying from 10*s.* 5*d.* in the last week of the quarter to 13*s.* in the fifth week.

The prices of potatoes at Dublin Market during the first quarter of 1865 averaged

Quarterly Reports.

First Quarter.

from 3*s.* 1*d.* to 3*s.* 7*d.* per cwt.; in the first three months of 1864 the average was 2*s.* 6*d.* to 3*s.* 3*d.*

The average price of beef at the Dublin Cattle market during the first three months of 1865, ranged from 54*s.* 6*d.* to 68*s.* per cwt. During the first quarter of 1864 the average prices were from 51*s.* 6*d.* to 64*s.* 6*d.* per cwt.

The average weekly number of persons in Ireland receiving in-door relief during the first quarter of 1865 was 61,895. During the first quarter of 1864 the average number was somewhat greater (64,059). During both periods the smallest number receiving in-door relief was in the first week in January, and the greatest number during the latter end of February. The average number receiving out-door relief during the first three months of 1864 was 9,822. In the corresponding period of 1865 the average number increased to 11,296.

HEALTH OF THE PEOPLE.

The mortality, which is invariably greatest in the first quarter of the year, was in some localities excessively high during the months of January, February, and March of the year 1865.

The increased mortality in these localities may be referred to two causes: in the first place, to the inclemency of the weather, and, in the second, to the prevalence of fever, scarlatina, small-pox and other zymotic diseases.

As to the first cause, the inclemency of the weather: from the meteorological returns furnished by Captain Wilkinson, it may be observed that the mean temperature of the air for the quarter ending March 31, 1865, was 38·9° Fahrenheit; whereas during the corresponding quarter of the year 1864 it was 40·2°, or 1·3° higher.

The lower temperature necessarily swelled the list of deaths from bronchitis and other pulmonary affections, especially amongst the aged and those of tender years.

Bronchitis proved very fatal throughout the country, and the following notes from Registrars will illustrate the lethal character of this disease to the old and the very young.

The Registrar of the Pomeroy district, in the Union or Superintendent Registrar's district of Cookstown, states that "more than three-fourths of the mortality was caused by chest affections, the average of the ages being 80 years."

The Registrar of the district of Aughnacloy, Union of Clogher, observes, "The increase of the deaths is among the aged, caused, in my opinion, by the severity of the winter. One person died aged 110 years, another aged 100, 7 between 80 and 90, and nine between 70 and 80."

Of the 17 deaths which took place in No. 2, Boyle district, Boyle Union, 10 were of children under 5 years of age, and 4 were of persons 60 years and upwards. Many other instances might be cited, were it necessary, to show how destructive cold weather is to the very young and the very old. Phthisis, or pulmonary consumption, carried off a great many; and pneumonia, or inflammation of the lungs, was, in many districts, very fatal.

With reference to the second cause of increased mortality during the quarter, *i.e.*, the prevalence of fever and other zymotic diseases—fever of a typhus type was the epidemic most general and most fatal throughout the country. Typhus was much more fatal in some districts than in others; invariably in the districts where sanitary precautions were not attended to the mortality from fever was greatest. Typhoid fever, typhia, or enteric fever, proved fatal in some parts of the country. The Registrar of the Cappoquin district, in the Union of Lismore, reported (April, 1865):—"Typhoid, typhia, or enteric fever, is spreading; it attacks chiefly children, and patients debilitated by other maladies; many old people also have died of it, but in them the symptoms are obscure, and the death usually referred to influenza, bronchitis, phthisis, &c. Some cases resembling relapsing fever, typhinia, or famine fever." In a few districts typhinia resulted in death.

Very many deaths were attributed to scarlatina. In almost all the returns ...nished by Registrars some deaths were ascribed to this disease. In many parts ...the country it proved very fatal. For instance, in the district of Oldcastle, ...the Union of Oldcastle, the Registrar reported "scarlatina has prevailed ...this district for the last six weeks; 4 deaths have resulted. In one house 3 ...ildren, the entire family, were cut off in four days."

In the district of Bangor, in the Superintendent Registrar's district of ...lmullet, the Registrar states that "the deaths were high, the district having ...en visited by an epidemic of scarlet fever, known as scarlatina maligna, of a ...st virulent type, which caused 28 deaths (the total for the district was 52), but ...is now happily on the decline;" and in the Registrar's district of Killeter, in the ...nion of Castlederg, "four persons, members of one family, were cut off within ...n days."

Many deaths resulted from measles. Croup and whooping-cough were very ...al; the former most so in the north-eastern division, the latter in the south-...stern.

From small-pox many deaths ensued. Nearly all those who perished had been ...protected by vaccination.

Some few of the Registrars reported that the sanitary condition of their districts ...s attended to; but, in the majority of the notes, complaints were made as to ...e utter neglect of sewerage, cleansing, or any other measure which might tend to ...e healthfulness of the localities.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, ...blin, during the quarter was 29·651 inches (that of the corresponding quarter ... 1864 was 29·725 inches); the highest reading (30·423 inches) occurred on ...e 10th February, at 9.30 A.M., wind E.S.E.; the minimum reading (28·357 ...hes) was on the 14th January, at 9.30 A.M., wind W.N.W.

The mean temperature of the air during the quarter was 38·9° (in the cor-...ponding period of 1864 it was 40·2°); the maximum registered by the ther-...meter was 60·9°; and the minimum was 20·4°. The temperature on the grass ...s below 32° on 24 nights of the month of January, on 13 nights in February, ...d on 19 nights in March.

The rain-fall during the quarter measured 5·979 inches (in the corresponding ...arter of 1864 it was 5·227 inches). The greatest rain-fall was in the month of ...bruary, when 2·788 inches were registered.

There was a prevalence of westerly winds, as it blew from that direction on 34 ...ys, viz., on 11 days in January, 11 days in February, 12 days in March; and ...m S.W. on 15 days—9 days in January, 5 days in February, and 1 day in ...rch, at 9.30 A.M.

UMBER OF MARRIAGES, BIRTHS, AND DEATHS, REGISTERED IN EACH OF THE EIGHT DIVISIONS

Into which Ireland has been divided for Statistical Purposes.

Marriages.—The number of marriages (2,802) registered in the South-Western ...vision during the quarter ending 31st March, represents an annual ratio of 1 ...rriage to every 74 of the estimated population. This very high rate is owing ...the custom which prevails amongst the Roman Catholic population, of having a ...ge proportion of the marriages of the year celebrated immediately before the ...mmencement of the Lenten Season. The annual ratio afforded by the number of ...rriages registered in this division during the last quarter of the year 1864 was only ...1 every 302 of the estimated population. In the Western Division the marriages

Quarterly Reports.

First Quarter.

registered in the first quarter of 1865 equalled an annual ratio of 1 in every 8 of the population against a ratio of but 1 in 441 in the last quarter of 1864.

The Eastern division is that in which the marriages registered during th quarter ending 31st March afford the lowest annual ratio, namely, 1 in every 17 of the population. The number of marriages registered in this division during th quarter ending 31st December, 1864, equalled an annual ratio of 1 in every 174.

The following statement shows the order in which the eight divisions stand wit regard to the number of MARRIAGES *in proportion to the estimated populatio (Quarter ending 31st March,* 1865) :—

Divisions.	Ratio.	Divisions.	Ratio.
1. South-Western,	1 in 74	5. North-Western,	1 in 138
2. Western,	,, 84	6. South Midland,	,, 139
3. South-Eastern,	,, 100	7. North-Eastern,	,, 158
4. North Midland,	,, 130	8. Eastern,	,, 170

Births.—The birth-rate during the first quarter was highest in the "Sout Western" division, the births *registered* (6,273) affording a ratio of 1 birth to ever 33 of the *estimated* population ; the birth-rate was highest in this division durin the first quarter of 1864 also.

The numerical order of the Eight Divisions as regards the annual Rate represent by the number of BIRTHS *registered during the* FIRST *quarter of* 1864 *and* 1865, *shown in the following statement :—*

Quarter ending 31st March, 1864.		Quarter ending 31st March, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.
1. South-Western,	1 in 37	South-Western,	1 in 3
2. South-Eastern,	,, 42	North-Eastern,	,, 3
3. South Midland,	,, 47	South-Eastern,	,, 3
4. North-Eastern,	,, 47	Eastern,	,, 3
5. Eastern,	,, 48	Western,	,, 3
6. North Midland,	,, 52	North-Western,	,, 4
7. Western,	,, 55	North Midland,	,, 4
8. North-Western,	,, 56	South Midland,	,, 4

The birth-rate was considerably higher in all the divisions during the fi quarter of 1865 than it was in the corresponding quarter of the previous ye The greatest increase was in the "Western" division, which rose from 1 in for the first quarter of 1864, to 1 in 38 for the corresponding quarter of 1865 ; the "North-Eastern," which had 1 in 47 for 1864, and 1 in 34 for 1865 ; and the "North-Western," in which the rate increased from 1 in 56 to 1 in 40.

Deaths.—The number of deaths (5,050) *registered* during the quarter, in t "Eastern" division, afforded the highest rate of mortality in proportion to the po lation, the ratio represented being 1 in 40. As heretofore the three divisions ly along the eastern coast had the highest rate of mortality.

The following statement shows the Eight Divisions, arranged according to annual RATE OF MORTALITY *afforded by the number of Deaths registered during* FIRST *quarter of* 1864 *and* 1865 :—

Quarter ending 31st March, 1864.		Quarter ending 31st March, 1865.	
Divisions.	Ratio.	Divisions.	Ratio
1. South-Eastern,	1 in 42	Eastern,	1 in
2. Eastern,	,, 43	South-Eastern,	,,
3. North-Eastern,	,, 45	North-Eastern,	,,
4. South Midland,	,, 51	South Midland,	,,
5. South-Western,	,, 53	South-Western,	,,
6. North-Western,	,, 55	North Midland,	,,
7. North Midland,	,, 57	North-Western,	,,
8. Western,	,, 69	Western,	,,

The death-rate was the same in the South-Eastern, the South Midland, the North-Western divisions, and was somewhat higher in all the others du the first quarter of 1865 than it was in the corresponding quarter of 1864.

Quarterly Reports.

First Quarter.

PROVINCES.

The following table shows the number of marriages *registered* in each of the four Provinces during the quarter ending 31st March, 1865; and the number of births and deaths *registered* during the quarters ending 31st March, 1865, and 1864, with the ratio to the population.

Table showing by Provinces, the number of Marriages registered during the quarter ending 31st March, 1865, and the number of Births and Deaths registered during the quarters ending 31st March, 1865, and 1864, with the ratio to the Population.

Marriages.—The marriages *registered* in the province of Leinster during the quarter ending 31st March, 1865, amounted to 2,197 a number equal to an annual ratio of 1 marriage to every 158 of the *estimated* population. In Munster there were registered 4,564 marriages, or 1 in every 81; in Ulster 3,025, or 1 in every 155; and in Connaught 2,522, or 1 in every 88 of the population.

Births.—The births *registered* during the first quarter of 1865 in Leinster, amounted to 8,960, or 1 in 39 of the population, against 1 in 48 during the corresponding quarter of 1864; in Munster, to 10,566, or 1 in 35, against 1 in 40; in Ulster, to 13,048, or 1 in 36, against 1 in 51; and in Connaught, to 5,746, or 1 in 38, against 1 in 53 for the corresponding quarter of 1864.

Deaths.—The number of deaths *registered* during the first quarter in Leinster, was 8,125, or 1 in 43 of the population, against 1 in 46 for the corresponding quarter of 1864; in Munster it was 7,486, or 1 in 50 against 1 in 51; in Ulster, it was 9,825, or 1 in 48, against 1 in 49; and in Connaught, 3,823, or 1 in 58, against 1 in 65 for the first quarter of 1864.

Second Quarter.—April, May, June.

Second Quarter.

Marriages.—The marriages *registered* in Ireland in the quarter ending the 30th June, 1865, amounted to 5,659, being equal to an annual ratio of 1 in every 249, or ·401 per cent. of the *estimated* population; of these marriages, 3,564 were between Roman Catholics (under the 26 and 27 Vic., cap. 90), and 2,095 between Protestants (under the 7 and 8 Vic., cap. 81)—the former number affording an annual ratio of 1 in 307 of the Roman Catholic population, and the latter of 1 in 150 of the Protestant population. The number of marriages *registered* in the corresponding quarter of 1864 was 6,023—4,091 of Roman Catholics and 1,932 of Protestants—being 364 more than were registered during the second quarter of 1865.

Quarterly Reports. Second Quarter.

Births.—The number of births *registered* during the quarter ending 30th June amounted to 39,109—19,988 boys and 19,121 girls—affording an annual ratio of 1 in 36·1 or 2·77 per cent. of the *estimated* population. The number of births *registered* in the corresponding quarter of 1864 was 38,715.

Deaths.—There were 24,250 deaths *registered* during the quarter—12,093 males and 12,157 females—being equal to an annual ratio of 1 in every 58·2 or 1·72 per cent. of the *estimated* population. The number of deaths *registered* during the corresponding quarter of 1864 was 24,155.

Emigration.—The number of persons leaving the ports of Ireland, who stated to the Enumerators "that it was *not their intention to return*," amounted, during the first quarter of 1865, to 15,848; during the second quarter the number was 37,588—20,175 males and 17,413 females—of whom 13,335 left during the month of April, 14,263 in May, and 9,990 in June. The number of emigrants who left during the second quarter of 1864 was 48,802, or 11,214 more than in the second quarter of 1865.

Decrease of the Population.—The number of emigrants who left Ireland during the first quarter of the year 1865 was more by 6,787 than the excess of births over deaths. The number of births *registered* during the second quarter, as already stated, amounted to 39,109, and the deaths to 24,250, showing an excess of 14,859 births over deaths, which if deducted from the number of emigrants, would show a further reduction in the population of 22,729, or a diminution during the first six months of the year of 29,516 persons.

PRICES OF PROVISIONS, AND PAUPERISM.

Sixpence was the price of the 4lb. loaf in Dublin during each week of the second quarter of 1865 and 1864. The average price of oatmeal per cwt. during the second quarter of 1865 was 14*s.* 1*d.*, the prices being very uniform throughout each week of the quarter; during the corresponding quarter of 1864, the average price was but 10*s.* 6*d.* The average prices per cwt. of potatoes, ranged from 3*s.* 2*d.* to 3*s.* 11*d.*; in the corresponding quarter of 1864 they were somewhat lower, viz., 2*s.* 11*d.* to 3*s.* 8*d.* Beef maintained a high price throughout the quarter, ranging from 55*s.* to 67*s.* 6*d.* per cwt., against 53*s.* to 65*s.* 6*d.* during the corresponding period of 1864.

The number of persons in Ireland receiving in-door relief on Saturdays during the second quarter of 1865, averaged 54,852, being 3,115 less than the average number in the corresponding period of 1864. The number relieved on Saturdays in the first week of the second quarter of 1865 was 60,100, which gradually decreased to 50,670, which was the number on Saturday, 1st July. The average number of persons in receipt of out-door relief was greater during the second quarter of 1865, than in the corresponding period of 1864; the respective numbers being 10,565 and 9,149. Of the persons receiving in-door relief during the second quarter of 1865, ·9 per cent. were located in asylums for the blind and the deaf and dumb and in extern hospitals. In the quarter ending 2nd July, 1864, the percentage was ·8.

HEALTH OF THE PEOPLE.

The health of the people was satisfactory throughout the quarter, owing to comparative freedom from epidemical diseases.

Small-pox appeared in a few districts. The beneficial effects of vaccination are well illustrated by the following notes. The Registrar of Crumlin district, in the Union of Antrim, remarks:—"There were a good many cases of small-pox in the district, but in *no case was the disease fatal or even severe where the patient had b*

reviously vaccinated, and in every instance those parties who had been re-vaccinated tely escaped the disease altogether, although in several cases members of the same mily were ill of small-pox at the time;" eight of the 32 deaths registered in the lonmany district, in the Union of Inishowen, were caused by this disease; the egistrar reports that 7 of the persons had not been vaccinated, and that the maining case was accompanied by acute bronchitis. Four deaths from this cause curred in the Glendermot district of the Londonderry Union; and 4 deaths curred in the Cork north city district—the persons had not been vaccinated.

Diphtheria prevailed in some of the districts in the north-eastern and north-estern divisions. Three deaths resulted from this cause in the Registrar's district Antrim. There were 2 deaths from it in the district of Tanderagee, in the nion of Banbridge. It is reported to have been epidemic at Bushmills, in the nion of Coleraine; 4 deaths from it were there registered. Four deaths from his disease occurred in Coal Island, Dungannon Union, and 4 in Glenavy, in the nion of Lisburn.

Deaths from Scarlatina occurred in most of the districts. It was particularly tal throughout the western and south-western divisions..

Fever is reported to have been very prevalent at Carrick-on-Suir; at Ballintra, Ballyshannon; and at Killeter, in Castlederg. It was also prevalent in the strict of Fanad, in Millford: the Registrar states that it was imported from lasgow by labourers.

The Registrar of the Dromore district, Union of Banbridge, states that of the 38 eaths registered during the quarter, 16 were caused by consumption—a disease hich he attributes to want of pure air in the dwellings of the people; he suggests ne passing of a "Compulsory Ventilation Act."

It is gratifying to observe that some of the Registrars were able to report improvements in the sanitary condition of their districts; amongst those districts may mentioned Lisburn; Moynalty, in the Union of Kells; Glengarriff, in Bantry nion; Ballincollig, in Cork Union; portions of Cork City; Maguiresbridge, in snaskea; Galway; &c. On the other hand, a long list of places is to be found the notes, concerning which the Registrars felt it their duty to complain; nongst these may be noticed—Portglenone, in the Union of Ballymena, "the avers' shops being often as damp as ill-drained cellars, and very frequently occued as sleeping-rooms;" the village of Legoniel, in the Registrar's district of ankill, Union of Belfast; Hillsborough, in Lisburn; Newtownards; Fintona, in nagh, in which, the Registrar reports, "3 deaths from fever occurred in one house here the sanitary arrangements were defective;" Ballymote, in Sligo, the Registrar ting that "the sanitary arrangements of both town and district are in total glect for want of proper authorities to look after such arrangements;" Carlingd, in Dundalk, the Registrar remarking on the non-observance of the "Nuisances moval Act;" Stillorgan, in Rathdown, in which the village of Newtownpark is ted to be defective in drainage and sewerage; Carrick-on-Suir, with regard to hich it is stated, "the sanitary condition of this town is (July, 1865) in a very bad te, it is in a low position, and very much in need of proper sewerage; some of e houses are over-crowded and badly ventilated;" Kilmeadan, in Waterford, which a prevalence of typhus fever is attributed to the noxious vapours given off in the cesspools opposite the doors of the houses.

The Registrar of the Bangor district, in Belmullet Union, says, "11 deaths in register are ascribed to scarlatina and its consequences; it is still (July, 1865) king about this district, owing, I believe, to the filthy state in which the people re keep their houses;" and the Registrar of Milltown Malbay, in Ennistimon, tes that between 50 and 60 cases of "Pythogenic fever" visited his district, and t he "failed in no instance to trace the cause to defective sanitary arrangements the sewerage about the houses or the wells from which their water supply was wn."

Quarterly Reports.

Second Quarter.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the quarter was 29·916 inches (in the second quarter of 1864 it was 29·871 inches); the highest reading (30·378 inches) was on the 13th June, at 9.30 A.M., wind N.; and the lowest (29·223 inches) on the 29th May, at 9.30 P.M., wind S.S.W.

The mean temperature of the air during the quarter was 54·8° (in the corresponding quarter of 1864 it was 53·6°); the maximum registered by the thermometer was 83·9°; and the minimum was 31·2°. The temperature on the grass was below 32° on 4 nights only, during the quarter, viz. :—1st, 10th, 15th, and 24th April.

The rain-fall during the quarter ending 30th June, measured 5·816 inches, it was only 4·083 inches in the corresponding portion of 1864. The greatest rain-fall was in the month of May, when 3·578 inches were registered.

The wind blew on 15 days from N.E.; on as many as 22 days from E.; on 16 days from S.W.; and on 17 days from W., at 9.30 A.M.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS REGISTERED IN EACH OF THE EIGHT DIVISIONS.

Marriages.—The North-Eastern Division was that in which the largest number of marriages in proportion to the estimated population was *registered* during the quarter ending 30th June; the number registered amounted to 1,597, equal to an annual ratio of 1 in 171; the number *registered* in the Eastern Division during the quarter was 1,160, affording a ratio of 1 in 174 of its population. The number of marriages *registered* in the Western Division amounted to 444 affording a ratio of only 1 in 451 of the inhabitants, whereas the number registered during the quarter ending 31st March, yielded a ratio of 1 in 84.

The following statement shows the order in which the Eight Divisions stand with regard to the number of MARRIAGES *in proportion to the population (Quarter ending 30th June,* 1865) :—

Divisions.	Ratio.	Divisions.	Ratio.
1. North-Eastern,	1 in 171	5. North-Western,	1 in 307
2. Eastern,	,, 174	6. South Midland,	,, 334
3. South-Eastern,	,, 253	7. North Midland,	,, 335
4. South-Western,	,, 286	8. Western,	,, 451

Births.—The birth-rate during the second quarter was highest in the North Eastern division and lowest in the Western division, the annual ratios represented in those divisions being, respectively, 1 in 31 and 1 in 43 of the population. The number of births registered in each division varies but little from the number registered in the corresponding quarter of 1864, when the annual ratios ranged from 1 in 32 in the South-Western division to 1 in 43 in the North-Western.

The numerical order of the Eight Divisions as regards the annual Rate represented by the number of BIRTHS *registered during the* SECOND *quarter of* 1864 *and* 1865, *shown in the following statement :—*

Quarter ending 30th June, 1864.		Quarter ending 30th June, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.
1. South-Western,	1 in 32	North-Eastern,	1 in 31
2. North-Eastern,	,, 33	South-Western,	,, 32
3. Eastern,	,, 35	Eastern,	,, 36
4. South-Eastern,	,, 36	South-Eastern,	,, 36
5. North Midland,	,, 40	North Midland,	,, 40
6 South Midland,	,, 40	North-Western,	,, 40
7. Western,	,, 41	South Midland,	,, 42
8. North-Western,	,, 43	Western,	,, 43

Quarterly Reports.

Second Quarter.

Deaths.—The annual rate of mortality represented by the number of deaths registered in each division during the second quarter of 1865, varies from 1 in every 49 of the population in the Eastern division to 1 in every 75 in the Western. In the corresponding quarter of 1864, the death-rate ranged from 1 in 51 to 1 in 77, the highest mortality having been in the South-Eastern division, and the lowest, as in the second quarter of 1865, in the Western. As in each previous quarter since the commencement of Registration, the three divisions lying along the eastern coast had the highest rates of mortality.

The following statement shows the Eight Divisions, arranged according to the annual RATE OF MORTALITY *afforded by the number of Deaths registered during the* SECOND *quarter of* 1864 *and* 1865:—

Quarter ending 30th June, 1864.		Quarter ending 30th June, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.
1. South-Eastern,	1 in 51	Eastern,	1 in 49
2. North-Eastern,	„ 51	North-Eastern,	„ 50
3. Eastern,	„ 53	South-Eastern,	„ 52
4. South-Western,	„ 59	South-Western,	„ 61
5. South Midland,	„ 60	South Midland,	„ 62
6. North-Western,	„ 60	North-Western,	„ 64
7. North Midland,	„ 73	North Midland,	„ 70
8. Western,	„ 77	Western,	„ 75

Comparing the mortality in each division during the second quarter of 1865 with that during the corresponding quarter of 1864, it is seen that the more important differences appear in the Eastern division, where the death-rate rose from 1 in 53 to 1 in 49, and in the North-Western division, in which it fell from 1 in 60 to 1 in 64.

PROVINCES.

The number of marriages registered in each of the four provinces during the quarter ending 30th of June, 1865, and the numbers of births and deaths registered in each province during the quarters ending 30th June, 1865, and 30th June, 1864, together with the annual ratio to the population, are shown in the following table:—

Table showing by Provinces, the number of Marriages registered during the quarter ending 30th June, 1865, *and of Births and Deaths* REGISTERED *during the quarters ending 30th June,* 1865, *and* 1864, *and the ratio to the Population.*

Registration Provinces.	Marriages.		Births.				Deaths.			
	Quarter ending 30th June, 1865.		Quarter ending				Quarter ending			
			30th June, 1865.		30th June, 1864.		30th June, 1865.		30th June, 1864.	
	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.
Leinster,	1,662	1 in 209	9,138	1 in 38	9,462	1 in 37	6,660	1 in 52	6,434	1 in 54
Munster,	1,225	304	10,931	34	10,999	34	6,143	61	6,308	59
Ulster,	2,223	211	13,801	34	12,784	37	8,447	56	8,518	55
Connaught,	549	403	5,239	42	5,470	41	3,000	74	2,895	77

Marriages.—The number of marriages registered in the province of Leinster during the quarter ending 30th June, amounted to 1,662, a number equal to an annual ratio of 1 in 209 of the population; in Ulster the ratio was 1 in 211, the number registered being 2,223; in Munster the ratio was 1 in 304, the number of

Quarterly Reports.

Second Quarter.

marriages being 1,225; there were only 549 marriages registered in Connaught, the ratio afforded by that number being but 1 in 403, whereas in the quarter ending 31st March the ratio in the two last-named provinces was 1 in 81 and 1 in 88, respectively—which may perhaps in some degree be accounted for by the usage among the Roman Catholic population, of having their marriages celebrated immediately before Lent, that is, during the first quarter of the year.

Births.—From the above table it will be seen that the number of births registered in the province of Leinster during the quarter ending 30th June, 1865, was 9,138; the annual ratio afforded being 1 birth in every 38 of the population against a ratio of 1 in 37 in the corresponding quarter of 1864; in Munster there were registered 10,931 births, or 1 in 34 of the population against 1 in 34 in the corresponding quarter of 1864; in Ulster 13,801, or 1 in 34 against 1 in 37; and in Connaught 5,239, or 1 in 42 against 1 in 41.

The provinces rank in the same order in the two quarters, viz.:—Munster, Ulster, Leinster, Connaught—Munster having the highest birth-rate.

Deaths.—The number of deaths registered in the province of Leinster during the second quarter of 1865 was 6,660—a number equal to an annual ratio of 1 death in 52 of the population; the ratio afforded by the deaths registered during the corresponding quarter of 1864 was 1 in 54. In Munster, there were registered 6,143 deaths, or 1 in 61 of the population against 1 in 59 for the quarter ending 30th June, 1864; in Ulster 8,447, or 1 in 56, against 1 in 55; and in Connaught 3,000, or 1 in 74 against 1 in 77, for the corresponding quarter of 1864.

The following was the order of the provinces with regard to mortality in proportion to population in the two quarters:—Leinster, Ulster, Munster, Connaught—Leinster having the highest mortality.

Third Quarter.

Third Quarter.—July, August, September.

Marriages.—The marriages *registered* in Ireland during the quarter ending September 30th amounted to 5,854, affording an annual ratio of 1 in 241, or ·41 per cent. of the *estimated* population; of these marriages, 3,613 were between Roman Catholics (under the 26 and 27 Vic., cap. 90); the Protestant marriages (under the 7 and 8 Vic., cap. 81) amounted to 2,241; the former number affords an annual ratio of 1 marriage to every 303 of the Roman Catholic population, and the latter 1 in every 140 of the Protestant population. The number of marriages *registered* in the corresponding period of 1864 was 5,512—3,397 of Roman Catholics and 2,115 of Protestants.

Births.—34,045 births were *registered* during the third quarter of 1865—17,522 males and 16,523 females—affording an annual ratio of 1 in every 41·4, or 2·41 per cent. of the *estimated* population; the number *registered* in the corresponding quarter of 1864, was 33,877.

Deaths.—The number of deaths *registered* during the quarter ending the 30th September amounted to 18,632—9,406 males and 9,226 females—being equal to an annual ratio of 1 in every 75·7, or 1·32 per cent. of the *estimated* population. The number *registered* in the corresponding quarter of 1864 was 19,191.

Emigration.—The number of persons who left the ports of Ireland, stating to the Enumerators "that it was their intention *not to return*," amounted, during the quarter ending the 30th September, 1865, to 27,661, being 5,523 more than the number during the corresponding period of 1864; the increase in July amounting to 667; in August, to 1,760; and in September, to 3,096. Of the 27,661 persons who emigrated during the quarter, 14,730 were males, and 12,931 females.

Quarterly Reports.

Third Quarter.

Estimated Decrease of the Population.—There would appear to have been a decrease of 12,248 in the population of Ireland, *estimated* according to the returns of births and deaths *registered* and of emigration received for the third quarter of 1865, the deaths (18,632) and the number of emigrants (27,661) amounting to 46,293, whereas the number of births *registered* was only 34,045. The estimated decrease of population in the first quarter of the year was 6,787; during the second quarter it was 22,729; and in the third quarter, as already stated, it was 12,248, making a total decrease for the *nine* months of 41,764 persons.

PRICES OF PROVISIONS AND PAUPERISM.

Provisions, in general, were higher in Dublin during the third quarter of 1865 than during the corresponding period of 1864. The price of Messrs. R. Manders and Co.'s 4lb. loaf, which was 6*d.* in the first week of the quarter in 1864, fell to 5½*d.* in the last, while, in the first week of the third quarter of 1865 it was 6*d.*, and in the last week 6½*d.*; the rise in the price took place in the tenth week. The *average* price of oatmeal at the Dublin Corn Exchange, for the third quarter of 1864, was but 10*s.* 8*d.*; for the third quarter of 1865 it was 15*s.* 3*d.*, ranging from 14*s.* 3*d.* to 17*s.*, the latter being the average price in the week ending Saturday, 19th August.

The price of potatoes, at the Dublin potato market, for the third quarter of 1865 was 2*s.* 8*d.* to 4*s.* per cwt.; in the corresponding quarter of 1864 it was somewhat lower, being from 2*s.* 7*d.* to 3*s.* 10*d.*

Beef maintained a very high price during the quarter, the range of price per cwt., during the quarter at the Dublin cattle market, being 56*s.* 6*d.* to 67*s.* 6*d.*; the highest weekly quotation, 60*s.* to 72*s.*, was for the week ending 2nd September. The *average* price of beef for the third quarter of 1864 was 51*s.* to 62*s.* 6*d.* per cwt.

The number of persons in Ireland receiving in-door relief weekly, during the third quarter of 1865, averaged 46,632, being 3,266 less than the average for the corresponding quarter of 1864; the number receiving in-door relief on Saturday, 8th July, was 50,085; the number for Saturday, the 30th September, was 45,384. In the first week of the corresponding quarter of 1864 the number was 54,079; and in the last week it was 48,535. The number of persons receiving out-door relief was greater in each week of the third quarter of 1865 than in the corresponding weeks of the third quarter of 1864; the weekly average number in the third quarter of 1865, was 9,093, against 7,717 for the corresponding period of 1864.

HEALTH OF THE PEOPLE.

The comparative freedom from epidemic disease, the fine dry weather, and, in general, the good wages and employment of the working classes, all combined to render the quarter ended September 30th unusually healthy.

The mortality during the quarter was less than in the corresponding period of 1864, and much below that of the quarter ended June 30th, 1865.

Fever, which for a considerable time had been prevalent in many parts of the country, was the cause of few deaths, and these chiefly occurred in localities where *sanitary precautions were wholly neglected*, and in which, owing to the continued dry weather, the supply of water was deficient.

The deaths from small-pox were comparatively few, and nearly all the persons who succumbed to the disease had *not been vaccinated*. In the Superintendent Registrar's district of Gortin (Plumb Bridge district), two persons who had not

Quarterly Reports — Third Quarter.

been vaccinated died from small-pox. The Registrar of Westport states that—"Small-pox made its appearance, but caused only one death, a child who *had not been vaccinated.*" The decrease in the mortality from small-pox may be justly attributed to the Compulsory Vaccination Act. Many of the Registrars refer with satisfaction to the efficient manner in which the provisions of the Act are carried out.

Scarlatina prevailed in some districts, and, as usual, was very fatal wherever the sewerage and other sanitary precautions were defective, for example, in the Union of Banbridge (Dromore district), out of 36 deaths, 10 were referred to scarlatina; the Registrar writes:—"The last-mentioned disease (scarlatina) prevailed in an unusually fatal form during the months of August and September, and was found in almost every case to be *associated with the existence of abominable cesspools and collections of filth about the doors, and under the windows of the houses; the houses also being generally damp and ill-ventilated.* One instance, in particular, which I was obliged to lay before the Board of Guardians, is worthy of note, as showing, with tolerable certainty, the relation these pestilential vats bear to the propagation of scarlet fever. In the midst of a cluster of houses situated on a badly-drained hillside, about two miles from Dromore, were four or five rare specimens of cesspools or gutters, *the stench from which was truly unbearable.* Scarlatina entered three of the families almost simultaneously, and when I visited the place, 7 cases were prostrated by the fever, and one child already dead. Compulsory measures were at once instituted for the speedy removal of the filth, and the filling up and covering over the pits, and *immediately* the progress of the endemic was arrested; those already ill gradually recovered, and no new case ensued subsequent to the removal of the nuisance."

In the Bray district, Rathdown Superintendent Registrar's district, 16 of the deaths were referred to scarlatina. The Registrar remarks:—"Supply of water, ventilation of houses and sewerage, *very defective in this district amongst the poor.*" In the Superintendent Registrar's district of Ennis, (Ennis district No. 1), of 110 deaths registered, 50 were caused by scarlatina. The Registrar states that "*the disease has confined itself almost exclusively to the ill-ventilated and filthy parts of the town.*" Scarlatina also prevailed in the adjoining districts, viz., Ennistimon and Newmarket. The majority of the deaths in the Clarina district (Superintendent Registrar's district of Limerick) were caused by scarlatina.

Diarrhœa was more than usually prevalent, and some cases of the ordinary autumnal cholera proved fatal; those cases which were attended with cramps, and were reported by the Registrars as closely resembling the Asiatic cholera, generally recovered. Diarrhœa caused 131 deaths in the Dublin Registration District during the quarter; of this number 55 were of infants under one year old, and 27 were of children between one and five years old.

The Registrar of Keady (Armagh) states that whooping-cough attacked many persons in advanced life. "In one case; an old lady, aged 80 years, is labouring under it in a severe form."

Some very old persons died during the quarter;—for example—in the Fintona district 5 had attained the age of 80 years; a man aged 100 died in the Milltown district (Mullingar Union), the Registrar states that "he could read without glasses up to the day of his death." Of those who died in the Moyne district (Thurles Union), 2 were upwards of 90, 5 over 80, and 3, 70 years and upwards. In the Clonmoyle district (Macroom Union) a widow had attained the age of 100, and a farmer 102 years. In the Loughrea district 4 of those who died were upwards of 80 years old; and in the Whitechurch district (Dungarvan Union) there died a centenarian.

Some of the Registrars referred with satisfaction to the improved sanitary condition of their districts; *but very many complained loudly of their filthy and utterly neglected state.*

As all matters connected with the maintenance of the health of the country are now so frequently brought under public notice, and as it is now universally admitted

hat fever, cholera, and all other epidemics commit the greatest ravages where sanitary measures are neglected, it is justly to be expected that those who have the power, such as Municipal Corporations, &c., will see the necessity of appointing competent officers of health throughout the country.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the quarter was 29·820 inches; (in the corresponding period of 1864 it was 29·804 inches); the highest reading (30·487 inches) was on the 24th September, at 3.30 P.M., wind E.; and the lowest (29·187 inches) was on the 11th August, at 9.30 A.M., wind W.S.W.

The mean temperature of the air during the quarter ended 30th September was 60·8°, which is 3° higher than that of the corresponding part of 1864 (57·8°), and higher than that of the third quarter of any year since 1835, in which year it reached 61·2°. The maximum registered by the thermometer (81·6°) occurred on the 15th September, and the minimum (36·5°) on the 22nd of the same month.

The rain-fall during the quarter measured 6·318 inches: it was only 4·137 inches in the corresponding part of 1864. In the half-year ended 30th September the rain-fall amounted to 12·134 inches; in the corresponding period of 1864 it was only 8·220 inches. The greatest monthly rain-fall during the quarter was in August, when 4·209 inches were registered.

The wind blew on 26 days from S.W., on 27 days from W., and on 15 days from E., at 9.30 A.M. On three days in September the air was calm at that hour.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS, REGISTERED IN EACH OF THE EIGHT DIVISIONS.

Marriages.—The number of marriages registered in the Eastern Division during the third quarter of 1865, afforded the highest annual ratio, viz.:—1 in 157 of the *estimated* population; in the North-Eastern Division the ratio was 1 in 164; in the North Midland Division the ratio was only 1 in 365; and in the Western Division 1 in 463.

The following statement shows the order in which the Eight Divisions stand, with regard to the number of MARRIAGES, *in proportion to the estimated population* (*Quarter ending 30th September*, 1865):—

Divisions.	Ratio.	Divisions.	Ratio.
1. Eastern,	1 in 157	5. North-Western,	1 in 314
2. North-Eastern,	,, 164	6. South Midland,	,, 320
3. South-Eastern,	,, 240	7. North Midland,	,, 365
4. South-Western,	,, 281	8. Western,	,, 463

Births.—The North-Eastern Division afforded the highest birth-rate for the quarter, the ratio being 1 in 36; the ratio in this division for the corresponding quarter of 1864 was 1 in 39.

The ratio in the Eastern Division for the third quarter of 1864, was 1 in 38; in the corresponding quarter of 1865 it was 1 in 40. The North-Western Division increased its birth-rate from 1 in 48, for the quarter ending 30th September, 1864, to 1 in 46 for the corresponding quarter of 1865; and the Western Division from 1 in 42 to 1 in 40. The birth-rate in the South-Midland Division was the same for both quarters, viz., 1 in 47.

Quarterly Reports.

Third Quarter.

The numerical order of the Eight Divisions as regards the annual Rate represented by the number of BIRTHS *registered during the* THIRD *quarter of* 1864 *and* 1865, *is shown in the following statement:—*

Quarter ending 30th September, 1864.		Quarter ending 30th September, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.
1. Eastern,	1 in 38	North-Eastern,	1 in 36
2. North-Eastern,	„ 39	Eastern,	„ 40
3. South-Western,	„ 41	Western,	„ 40
4. Western,	„ 42	South-Western,	„ 42
5. South-Eastern,	„ 43	South-Eastern,	„ 45
6. North Midland,	„ 46	North Midland,	„ 45
7. South Midland,	„ 47	North-Western,	„ 46
8. North-Western,	„ 48	South Midland,	„ 47

Deaths.—The annual rate of mortality shown by the number of deaths *registered* in the Eastern Division during the quarter, was 1 in 59, which was the highest ratio afforded by any of the Eight Divisions; the deaths *registered* in the Western Division represent an annual ratio of only 1 in 95 of the population for the third quarter, and represented only 1 in 98 for the corresponding quarter of 1864. The death-rate in the South Midland Division, was 1 in 72 for the third quarter of 1864, against 1 in 83 for the corresponding quarter of 1865; in the South-Western, 1 in 73 against 1 in 78; in the North-Western, 1 in 81 against 1 in 88; and in the South-Eastern, 1 in 66 against 1 in 71.

The following statement shows the Eight Divisions, arranged according to the annual RATE OF MORTALITY *afforded by the number of Deaths registered during the* THIRD *quarter of* 1864 *and* 1865:—

Quarter ending 30th September, 1864.		Quarter ending 30th September, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.
1. Eastern,	1 in 63	Eastern,	1 in 59
2. South-Eastern,	„ 66	North-Eastern,	„ 67
3. North-Eastern,	„ 67	South-Eastern,	„ 71
4. South Midland,	„ 72	South-Western,	„ 78
5. South-Western,	„ 73	South Midland,	„ 83
6. North-Western,	„ 81	North-Western,	„ 88
7. North Midland,	„ 91	North Midland,	„ 91
8. Western,	„ 98	Western,	„ 95

PROVINCES.

The number of marriages registered in each of the four provinces during the quarter ending 30th September, 1865, and the numbers of births and deaths registered in each province during the quarters ending 30th September, 1865, and 30th September, 1864, together with the annual ratio to the *estimated* population, are shown in the following table:—

Table showing by Provinces, the number of Marriages registered during the quarter ending 30th September, 1865, *and of Births and Deaths* REGISTERED *during the quarters ending 30th September,* 1865, *and* 1864, *and the Ratio to the estimated Population.*

Registration Provinces.	Marriages.		Births.				Deaths.			
	Quarter ending 30th September, 1865.		Quarter ending				Quarter ending			
			30th Sept., 1865.		30th Sept., 1864.		30th Sept., 1865.		30th Sept., 1864.	
	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.
Leinster,	1,765	1 in 197	8,125	1 in 43	8,521	1 in 41	5,467	1 in 64	5,269	1 in 66
Munster,	1,327	280	8,533	44	8,714	43	4,709	79	5,105	73
Ulster,	2,248	209	11,783	40	11,113	42	6,187	76	6,486	73
Connaught,	514	430	5,604	39	5,529	40	2,269	97	2,331	95

Quarterly Reports.

Third Quarter.

Marriages.—The number of marriages *registered* in the Province of Leinster during the third quarter of 1865 amounted to 1,765, a number affording an annual ratio of 1 in 197 of the *estimated* population; in Munster the number of marriages was 1,327 or 1 in 280 of the population; in Ulster 2,248 or 1 in 209; and in Connaught 514, or only 1 in 430 of the population.

Births.—The births registered in the province of Leinster during the quarter ending 30th September, amounted to 8,125, a number affording an annual ratio of 1 in 43 of the population; in the corresponding quarter of 1864 the ratio was 1 in 41; the number of births *registered* in Munster during the quarter was 8,533, equal to an annual ratio of 1 in 44 against a ratio of 1 in 43 in the third quarter of 1864; in Ulster the number was 11,783, or 1 in 40 against 1 in 42; and in Connaught, 5,604, or 1 in 39 against 1 in 40.

From the foregoing statement it will be observed that the province of Connaught had the highest birth-rate for the third quarter of both 1864 and 1865, and the province of Munster the lowest.

Deaths.—There were registered in the province of Leinster, during the quarter ending 30th September, 5,467 deaths—the annual ratio afforded being 1 in 64 against 1 in 66 for the corresponding quarter of 1864; in Munster the deaths registered were 4,709, or 1 in 79 against 1 in 73 for the third quarter of 1864; in Ulster they were 6,187, or 1 in 76 against 1 in 73; and in Connaught, 2,269, or 1 in 97 against 1 in 95 for the corresponding quarter of 1864.

Thus it will be seen that the number of deaths *registered* in each of the provinces, with the exception of Leinster, yielded a lower ratio in the third quarter of 1865 than in the corresponding quarter of 1864. In both quarters the death-rate was highest in Leinster, and lowest in Connaught.

Fourth Quarter.—October, November, December.

Fourth Quarter.

Marriages.—There were 6,981 marriages *registered* in Ireland during the fourth quarter of 1865, a number affording an annual ratio of 1 in every 202 or ·495 per cent. of the *estimated* population. Of this number, 4,433 were between Roman Catholics, representing a ratio of only 1 marriage in every 247 of Roman Catholics, and 2,548 were between Protestants, affording a ratio of 1 in every 123 of the Protestant population. The number of marriages registered in the corresponding quarter of the year 1864 was 6,269.

Births.—The number of births *registered* during the last quarter of the year 1865, amounted to 33,496—17,153 males and 16,343 females—affording an annual ratio of 1 in every 42·1, or 2·37 per cent. of the *estimated* population; during the corresponding quarter of 1864, the number *registered* was 33,643.

Deaths.—The deaths *registered* during the fourth quarter amounted to 21,013—10,483 males and 10,530 females—affording an annual ratio of 1 death in every 37·1 or 1·49 per cent. of the population. The number *registered* during the last quarter of the year 1864 was 21,755.

Emigration.—The number of persons who left the ports of Ireland, according to the returns obtained by the Enumerators, amounted, during the quarter ended December 31st, to 20,400, showing an increase of 4,796 (3,917 males and 879 females) when compared with the number who emigrated during the corresponding quarter of 1864. Of the 20,400 persons who left the country during the quarter, 11,655 were males, and 8,745 females.

Quarterly Reports.

Fourth Quarter.

Estimated Decrease of the Population.—The number of births *registered* during the quarter, as before stated, having been 33,496; the deaths, 21,013; and the number of emigrants (according to the returns obtained), 20,400;—a decrease of 7,917 would, therefore, appear to have taken place in the population during that period.

PRICES OF PROVISIONS AND PAUPERISM.

During the fourth quarter of 1865 the average price of bread in Dublin was 7*d.* the 4lb. loaf, showing an advance of 1½*d.* per 4 lbs. as compared with the corresponding period of 1864. Oatmeal, the price of which averaged in the last quarter of 1864 10*s.* 10*d.* per cwt., rose during the corresponding quarter of 1865 to 15*s.* 1*d.* per cwt. The average price of potatoes was also higher when compared with corresponding period of 1864; in the quarter ended December 31st, 1865, the average price of potatoes in the Dublin market was from 2*s.* 9*d.* to 3*s.* 8*d.* per cwt., and during the last quarter of 1864 the average price was 2*s.* 2*d.* to 3*s.* 4*d.* per cwt. Prime beef averaged lower (63*s.* 6*d.* per cwt.) than during the corresponding quarter of 1864, when the average price was 65*s.* 6*d.* per cwt.; on the other hand inferior beef was 1*s.* per cwt. higher.

The number of persons in Ireland receiving in-door relief weekly, during the quarter ended December 31st, 1865, averaged 49,457, being a decrease of 4,31 when compared with the corresponding period of the year 1864. The average number of persons receiving out-door relief during each week of the last quarter of the year 1865 was 8,859, being 1,292 more than the average number who received out-door relief during the fourth quarter of the year 1864.

HEALTH OF THE PEOPLE.

The quarter ended December 31st, was notably healthy; this may be ascribed to three causes—1st to the general subsidence of zymotic diseases; 2ndly, to the mildness of the season; and 3rdly, to the greater demand for labourers, and the consequent increased rate of wages.

Fever, though prevalent in some districts, was not so fatal as during the first nine months of the year; and in other localities where it had prevailed to a large extent, it nearly altogether disappeared.

Scarlatina, though very fatal in those parts of the country where sanitary precautions are neglected, was mostly of a mild type. Thus in the Registrar's District of Delgany (Rathdown Union) 44 cases occurred, "but all terminated favourably."

To the very satisfactory results arising from the working of the Compulsory Vaccination Act, many of the Registrars bear willing testimony—nearly all the deaths ascribed to small-pox having occurred in individuals who had *not been previously vaccinated.* There were 18 cases of small-pox in the Ballymoney Dispensary District. "Two deaths occurred; in each case the form was confluent and the patient *not vaccinated.*" The Registrar of Belfast District, No. 4, states that out of 253 deaths "I have not had one case of small-pox, and I believe the Compulsory Vaccination Act is working well."

The Registrar of the Whitechurch District (Dungarvan Union) observes that "there were no cases of small-pox, during the quarter, which may be attributed to the Compulsory Vaccination Act, which is working most satisfactorily."

Measles proved less fatal during this than the preceding quarter, and fewer deaths were attributed to whooping-cough.

Very many of the Registrars again complained of their districts being utterly neglected in a sanitary point of view. They alluded to the high death-rate in those parts where sewerage and other hygienic measures were not resorted to.

On the other hand, the medical officers of those districts where sanitary improvements had taken place, with satisfaction recorded the beneficial results.

Quarterly Reports.

Fourth Quarter.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the quarter was 29·674 inches (in the corresponding period of 1864 it was 29·686 inches; the highest reading (30·644 inches) was on the 15th December, at 9.30 P.M., wind S.W.; and the lowest (28·394 inches) was on the 22nd November, at 9.30 A.M., wind N.W.

The mean temperature of the air during the last quarter of 1865 was 46·5° during the corresponding period of 1864 it was 44·4°); the maximum registered by the thermometer (71·8°) occurred on the 3rd October, and the minimum (27·3°) on the 21st of the same month.

The rain-fall during the quarter measured 10·112 inches; in the last quarter of 1864 it was 12·040 inches. The greatest monthly rain-fall during the quarter was in November, when 3·533 inches were registered. The rain-fall in October only measured 3·291 inches, against 6·167 inches in the corresponding month of 1864.

The wind blew on 21 days from W.; 18 days from S.W.; 9 days from S.; 9 days from S.E.; and 13 days from E., at 9.30 A.M. The air was calm on 7 days at that hour.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS REGISTERED IN EACH OF THE EIGHT DIVISIONS.

Marriages.—The North-Eastern Division had the highest marriage rate during the fourth quarter of 1865, the number registered affording an annual ratio of 1 in every 126 of the *estimated* population. In the Eastern Division the annual ratio represented by the number of marriages registered was 1 in every 152, while in the South-Western Division the ratio was only 1 in 278, and in the Western but 1 in every 363 of the estimated population.

The following statement shows the order of the Eight Divisions with regard to the number of MARRIAGES *in proportion to the estimated population (Quarter ending 31st December,* 1865):—

Divisions.	Ratio.	Divisions.	Ratio.
1. North-Eastern,	1 in 126	5. North Midland,	1 in 254
2. Eastern,	,, 152	6. South Midland,	,, 256
3. North-Western,	,, 224	7. South-Western,	,, 278
4. South-Eastern,	,, 238	8. Western,	,, 363

Births.—The Births *registered* during the last quarter of 1865 in the North-Eastern Division amounted to 7,349, affording an annual ratio of 1 in 37 of the *estimated* population; in the corresponding quarter of 1864 the ratio was 1 in 38; in the South Midland Division the ratio afforded was only 1 in 52 against 1 in 50 for the corresponding period of 1864.

The order of the Eight Divisions as regards the Annual Rate represented by the number of BIRTHS *registered during the* FOURTH *quarter of* 1864 *and* 1865, *is shown the following statement:—*

Quarter ending 31st December, 1864.		Quarter ending 31st December, 1865.	
Divisions.	Ratio.	Divisions.	Ratio.

8. South Midland,	,, 50	South Midland,	,, 52

Quarterly Reports.

Fourth Quarter.

Deaths.—The Eastern Division had the highest death-rate during the fourth quarter, the annual ratio afforded being 1 in 51 of the estimated population; in the corresponding quarter of 1864 the death-rate in this division was 1 in 54. In the North Midland Division the deaths *registered* during the fourth quarter of 1865 represent an annual ratio of but 1 in 83, against 1 in 80 for the fourth quarter of 1864; in the North-Western Division the ratio was only 1 in 84, against 1 in 78, and in the Western it was only 1 in 90, against 1 in 86 for the corresponding quarter of 1864.

The following statement shows the Eight Divisions arranged according to the annual RATE OF MORTALITY *afforded by the number of Deaths registered during the* FOURTH *Quarter of* 1864 *and* 1865.

Quarter ending 31st December, 1864.		Quarter ending 31st December, 1865.

Marriages.—The number of marriages *registered* in the province of Leinster during the fourth quarter of 1865, amounted to 1,960, a number representing an annual ratio of 1 in every 177 of the estimated population; in Munster the number was 1,281 or 1 in 290; in Ulster 3,076 or 1 in 153; and in Connaught 664 only 1 in 333.

Births.—The births (7,437) *registered* in Leinster during the fourth quarter of 1865 afford an annual ratio of only 1 in 47 of the estimated population—in

Quarterly Reports.
Fourth Quarter.

corresponding quarter of 1864 the ratio was 1 in 45. In Munster there were registered 8,710 births—a number equal to an annual ratio of 1 in 43 (a similar ratio to that afforded by the number registered in the fourth quarter of 1864); in Ulster the number was 11,729 or 1 in 40 against 1 in 40 for the corresponding quarter of 1864; and in Connaught 5,620 or 1 in 39, against 1 in 41.

Deaths.—There were 6,062 deaths registered in the province of Leinster during the fourth quarter of 1865, the annual ratio afforded being 1 in 57—in the fourth quarter of 1864 the ratio was 1 in 58. In Munster there were registered 5,491 deaths or 1 in 68 of the estimated population, against 1 in 65 for the corresponding quarter of 1864; in Ulster, 6,959 or 1 in 67, against 1 in 65; and in Connaught, 2,501, or only 1 in 88, against 1 in 83 for the fourth quarter of 1864.

Topographical Description of the Eight Divisions into which Ireland has been divided in the foregoing Tables.

No. I. The North-Eastern Division.—This division may be described by a line passing southward from Lough Foyle through the counties of Londonderry, Tyrone, and Armagh, to Lough Bawn, in the county of Monaghan, and thence eastward to Carlingford Lough; the north and east being on the seaboard.

No. II. The North-Western Division is bounded on the east by the division just described, from Lough Foyle to a point a little south of Six Mile Cross, in the county of Tyrone, and may be described by a line drawn thence S.W. through the county of Fermanagh to the south of Enniskillen, embracing that portion of the north-west angle of the county of Cavan belonging to the Enniskillen Union, into the county of Leitrim, crossing Lough Allen, thence into the county of Sligo, to a point situated to the southward of the town of Ballymote, and thence extending north to Ballysadare Bay; the remainder of the division is bounded by the sea. It contains Loughs Erne and Derg, and part of Lough Allen, and large portions of it are mountainous.

No. III. The Eastern Division is situated in the provinces of Leinster and Ulster; it extends along the Irish Sea and St. George's Channel, from Warrenspoint, in the county of Down, to the south of Cahore Point, in the county of Wexford, stretching inland about twenty-five miles, and embracing the counties of Louth, Dublin, and Wicklow, and portions of the counties of Carlow, Cavan, Kildare, Meath, and Wexford; together with small portions of the counties of Armagh and Monaghan.

No. IV. The North Midland Division is situated in the provinces of Leinster, Ulster, and Connaught, and extends southward from its junction with the "North-Western" division near Six Mile Cross, in the county of Tyrone, to Tyrrellspass, in the county of Westmeath. Virginia, in the county of Cavan, is situated on its eastern border, and Tulsk, in the county of Roscommon, on its western.

No. V. The South Midland Division, situated in the provinces of Leinster and Munster, extends from the Hill of Down, in the county of Meath, southward to Borris, in the county of Carlow. Its southern boundary may be described by a line drawn thence to New Birmingham, in the county of Tipperary, and from that point south to Fethard, in the same county, thence westward to the northern base of the Galty Mountains, and in a north-westerly direction, to Pallasgreen, in the county of Limerick. On the east it is bounded by the "Eastern" division, and on the west by the "Western" and the "South-Western" divisions.

Quarterly Reports.

Fourth Quarter.

No. VI. The Western Division.—This division extends southwards from Sligo and Killala Bays to the northern bank of the River Shannon, lying westward of Limerick; the extreme points, north and south, being Benwee Head, in the county of Mayo, and Loop Head, in the county of Clare, a distance in or about 120 miles, which, however, does not represent the extent of seaboard, the western coast being indented by numerous bays and inlets. This division has been extended much more inland than the eastern division, as from its exposure to the Atlantic Ocean, and the prevalence of westerly winds (which blow for nearly three-fourths of the year), the climate must be affected for a considerable distance inland; the Unions situated on the extreme east are Boyle, Castlereagh, Glennamaddy, Mountbellew, Ballinasloe, and Portumna.

No. VII. The South-Eastern Division.—This division extends from its junction with the "Eastern" division southward of Cahore Point, in the County of Wexford, along the eastern and southern coasts to the east of Cork Harbour, and is bounded on the north by the South Midland division. It embraces the County of Waterford; nearly the whole of the County of Wexford; parts of the counties of Carlow, Kilkenny, and Tipperary; that portion of the County of Limerick (38,550 acres) comprised in the Mitchelstown Union, and a portion of the eastern side of Cork County.

No. VIII. The South-Western Division extends along the southern and western coasts from Cork Harbour to the River Shannon, and embraces the County of Kerry, nearly the whole of the Counties of Cork and Limerick, and a small portion of the County of Clare, comprised in the Limerick Union.

POPULATION OF IRELAND (including Army, Navy, and Merchant Seamen on shore and in port) *estimated* to the middle of each of the Years 1801 to 1865 :—

NOTE.—This table has been constructed for the years 1801 to 1831—By adopting the rates of increase of the male and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first complete Census of Ireland having been taken in 1821.

1832 to 1841—By adopting the rate of increase between the population of 1831 and 1841, according to the Irish Census Report of 1841.

1842 to 1846—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting the annual emigration from Ireland according to the returns received from the Emigration Commissioners in England.

1847 to 1851—The English birth-rate, as above, was used, deducting the number of deaths and the number of emigrants in each year, as given in the Irish Census Reports of 1851 ; the difference between the number arrived at by this computation and the *actual* number by the Census of 1851 was divided over the intervening years in proportion to the number of recorded deaths and the number of emigrants.

1852 to 1861—The English birth and death rates, as above, were used, deducting the number of emigrants according to the returns obtained by the Registrar-General for Ireland, and apportioning the difference as explained for the last period.

1862 to 1865—The English birth and death rates, as above, were employed in the calculations for each year, deducting the number of emigrants according to the returns received by the Registrar-General for Ireland.

ANNUAL ABSTRACTS

OF

MARRIAGES, BIRTHS, AND DEATHS.

1865.

ABSTRACT OF MARRIAGES.—Marriages *registered* in Ireland, pursuant to the

DIVISIONS AND SUPERINTENDENT REGISTRARS' DISTRICTS.*	Area in Statute Acres, exclusive of the larger Rivers, Lakes, and Tideways.	Population, 1861.	TOTAL MARRIAGES.	MARRIAGES, Registered under the Act 7 & 8 Vic., c. 81. According to the Rites of the Established Church. Special Licence.	Licence.	Banns.	Registrar's Certificate.	Not stated by which of the foregoing Forms.	TOTAL.	Not according to the Rites of the Established Church. In Registered Presbyterian Meeting Houses.	In Registered Buildings.	In the Registrar's Office.	Society of Friends.	Jews.	TOTAL Registered under the Act 7 & 8 Vic., c. 81.

* The *Registration Counties* consist of groups of Superintendent Registrars' Districts or Poor Law Unions. Whenever a district or Union extends into more than one County, it is assigned wholly to that County in which the greater portion of the population is located; hence all the *Registration* Counties differ more or less from the Counties *Proper*.

† See note (†) page 2.

NOTE.—The Registrars' Districts are sub-divisions of the Unions or Superintendent Registrars' Districts, and are identical with the Dispensary Districts of the same names, except in a few instances.

The letter *W* denotes that the Registrar's District contains within its limits the Workhouse belonging to the Union or Superintendent Registrar's District.

Wherever the minus sign (—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births in the Registrar's District, instead of exceeding the deaths, were, in fact, *less than the deaths*, to the extent stated.

* Including six Registration Districts. † Including three Registration Districts.

IRELAND.—SUPPLEMENTARY TABLE

[In the foregoing Tables all the Diseases, either having a distinct character, or fatal to any consid number of persons, are classified under 114 heads; some of which, however, include groups of very di diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other dis The rule has been to refer the distinct diseases to heads under which the cases were so numerous th additional numbers would not interfere with the calculated proportions. Where it is desired, partial corre

The *Registration Counties* consist of groups of Superintendent Registrars' Districts or Poor Law Unions. Whenever a District or on extends into more than one County, it is assigned wholly to that County in which the greater portion of the population is located; e all the *Registration* Counties differ more or less from the Counties *Proper*.

Letter to the Registrar-General on the Causes of Death in Ireland, from William M. Burke, f.c.p.i.

Year 1865.

Sir,

I have the honour of bringing under your notice an analysis of the causes assigned for the deaths *registered* in Ireland during the year 1865.

I. Zymotic Diseases.

Of the deaths registered, 19,802 were referred to zymotic diseases, being 1 in every 4·7 of the total deaths, and showing that, in every 1,000 of the estimated population, 3·5 died from zymotic diseases.

The deaths from fever amounted to 5,283, or 1 in every 17·6 of the total deaths. Under the head of fever, the deaths from typhus, typhoid, or enteric, relapsing fever or typhinia, and infantile remittent fever are included. Of the persons whose deaths were caused by fever, 2,748 were males, and 2,535 were females.

Scarlet fever proved more fatal by 1,078 deaths than in the year preceding. The number of deaths registered from this disease amounted to 3,683, or 1 in every 25·3 of the total deaths registered. The divisions which suffered most from this scourge were the western and the south-western.

Diarrhœa proved fatal in 2,139 instances, against 1,962 in the year 1864, and showing a proportion of 1 to every 43·6 of the total deaths.

1,861 deaths, or 1 in every 50·1 of all the deaths, resulted from croup.

To whooping cough, 1,506 deaths—657 males and 849 females—were ascribed.

Measles caused 1,036 deaths, being 406 more than were registered in the year preceding.

Diphtheria caused 480 deaths. This disease proved most fatal in the north-eastern division.

The deaths from small-pox exhibit a remarkable decrease. In the year 1864 the deaths registered from small-pox amounted to 854, whereas during the year 1865 the deaths from this disease only reached 461, or 46 per cent. less than in the preceding year, when the Compulsory Vaccination Act came into operation.

Four males and 1 female died from hydrophobia.

Nine deaths resulted from glanders—all the victims were males.

II. Constitutional Diseases.

The deaths tabulated under the head of constitutional diseases amounted to 18,046, being in the proportion of 1 in every 5·2 of all the deaths, and 3·2 in every 1,000 of the estimated population.

Phthisis, or pulmonary consumption, caused 10,176 deaths—4,928 males, and 5,248 females. The decennial period, in which the greatest number fell victims to phthisis, was from the 15th to the 25th year.

To dropsy, which is so frequently but a fragment or symptom of some organic disease, 2,004 deaths (883 males, 1,121 females) were referred.

1,601 deaths resulted from cancer: of these 692 were males, and 909 females.

Tabes mesenterica was the assigned cause of death in 1,592 instances.

Hydrocephalus caused 1,108 deaths.

Under the head of scrofula 1,252 deaths were tabulated.

III. Local Diseases.

The number of deaths attributed to local diseases amounted to 32,554, or 1 in every 2·9 of all the deaths, and showing a ratio of 5·8 deaths to 1,000 of the estimated population.

Diseases of the nervous system contributed 8,846 deaths—4804 males, and 4,042 females; about one-half of these were ascribed to convulsions. The deaths from apoplexy numbered 1,018—595 males, and 423 females. 1,840 deaths were referred to paralysis; of these 897 were males, and 943 females. Cephalitis, or inflammation of the brain, &c., caused 567 deaths; of these 223 occurred in the north-eastern division. Under the head of brain disease unspecified 799 deaths were returned, against 1,182 in the year 1864.

Diseases of the circulatory organs caused 2,922 deaths; of these, 89 deaths (54 males, and 35 females) resulted from pericarditis or inflammation of the membrane investing the heart; 103 deaths were caused by aneurism—79 males, and 24 females. 2,730 deaths (1,423 males, and 1,307 females) were returned under the head of heart disease unspecified.

Diseases of the organs of respiration, exclusive of pulmonary consumption, caused 14,429 deaths—7,112 males, 7,317 females. Bronchitis proved fatal in 10,389 instances—4,879 males, 5,510 females. Inflammation of the lungs was the cause of 1,817 deaths—1,118 males, and 699 females. To asthma 890 deaths were attributed; 450 to pleurisy; and 171 to laryngitis. Under the head of lung disease unspecified 712 deaths were returned, against 904 so returned in the year 1864.

4,736 deaths (2,608 males, and 2,128 females) were attributed to diseases of the digestive organs. Inflammation of the bowels caused 598 deaths—360 males, and 238 females. Peritonitis was fatal in 270 instances—136 males, and 134 females; 239 deaths were ascribed to gastritis or inflammation of the stomach. From ileus, which includes deaths from obstruction of the bowels, constipation, &c., there died 432—288 males, and 144 females. To diseases of the stomach unspecified 1,104 deaths were attributed. Inflammation of the liver is the cause assigned for 258 deaths; jaundice for 239; and liver disease unspecified 863.

The deaths from diseases of the urinary organs amounted to 1,002—746 males, and 256 females. Of the deaths from diseases of the urinary organs, 38 were referred to inflammation of the kidneys; 201 to nephria or Bright's disease; 49 to stone in the bladder; 59 to inflammation of the bladder; 106 to diabetes; and 427 to kidney disease unspecified.

Diseases of the organs of generation resulted in 174 deaths—4 males, and 170 females.

To diseases of the organs of locomotion 203 deaths were attributed—118 males and 85 females.

Under the head of diseases of the integumentary system 242 deaths were returned, viz., 12 from phlegmon; 100 from ulcer; and 130 from skin disease unspecified.

IV. Developmental Diseases.

The number of deaths referred to diseases incidental to the development of the body amounted to 15,264, or 1 in every 6·1 of the total deaths, or 2·7 deaths in every 1,000 of the estimated population.

To premature birth 241 deaths were referred; 18 to cyanosis; of these latter 13 died under 1 year old, 2 between 1 and 2 years, 1 between 2 and 3 years, 1 between 3 and 4 years, and 1, a male, who died in the Roscrea Workhouse, had attained the unusual age of 27 years. Spina bifida caused 22 deaths; 22 were returned under the head of "other malformations;" and 349 deaths were ascribed to teething.

Twenty-three deaths were returned as caused by paramenia or disordered menstruation.

The number of women who died in childbirth amounted to 644; by adding the deaths from metria or puerperal fever, it will be found that the total deaths *registered* from child-bearing amounted to 928, so that, according to the number of births registered during the year, the death of 1 mother occurred to every 156 children born.

Old age is the cause assigned for the deaths of 9,702 persons—4,045 males, and 5,657 females.

To atrophy and debility 4,243 deaths—2,025 males, and 2,218 females—were attributed.

V. Violent Deaths.

The deaths from violence recorded during the year amounted to 2,183, or 4 deaths in every 10,000 of the estimated population, and 1 in every 42·7 of the total deaths.

Of the above deaths, 1,987 were the result of accident, viz., 682 from fractures and contusions; 38 from gunshot wounds; 48 from cuts or stabs; 509 from burns or scalds—248 males, and 261 females. Of the total deaths registered, 1 in every 183 was from the effects of fire; of the 248 males who perished from fire and its effects 180 were under five years old; and of the 261 females 158 were under 5 years old. Accidental poisoning caused 17 deaths. 482 persons—383 males, and 99 females were accidentally drowned. To suffocation 71 deaths were referred. A like number of deaths from suffocation occurred in the previous year. Of the 71 persons whose deaths were caused by suffocation, 37 were infants under 1 year old. In 140 instances the nature of the accident which caused death was not specified.

69 deaths—47 males, and 22 females—were tabulated under the head of homicide; of these 25 were infants.

The deaths from suicide amounted to 77—58 males, and 19 females, or 14 persons out of 1,000,000 of the estimated population, perished by their own hands.

The means adopted for self-destruction were—gunshot wounds, 5 men; cuts and stabs, 17 men and 4 women; drowning, 7 men and 4 women; hanging, 19 men and 11 women; and in the cases of 10 men the mode of self-destruction was not stated in the returns.

Two men were executed during the year.

Of the violent deaths 48 were not classed. The number of violent deaths unclassed in the year 1864 amounted to 134.

Of 452 sudden deaths returned, the cause was unascertained.

In 4,853 instances, or 1 in 19·2 of the total deaths, the cause of death was unspecified, or so ill-defined as not to admit of classification in the tables. This exhibits an improvement on the previous year, when 6,504, or 1 in 14·3 of the deaths were so returned.

I have the honour to be,
Sir,
Your obedient servant,
W. M. BURKE.

To
The Registrar-General.

INDEX OF SUPERINTENDENT REGISTRARS' DISTRICTS.

ABSTRACTS:—

Marriages registered in Ireland in each of the Divisions and Superintendent Registrars' Districts, also in each Province and County, in 1866, distinguishing Roman Catholic from Protestant Marriages, and giving the Total Number registered in each Quarter of the Year; the Conjugal Condition of Persons Married; the Number of Minors, and of those who signed the Registers by Marks, ... 2–11

Ages of 25,784 Persons married in 1866, distinguishing those of Bachelors, Spinsters, Widowers, and Widows, ... 12, 13

Marriages, Births, and Deaths registered in each of the Divisions and Superintendent Registrars' Districts, and in each Province and County in 1866; also Births and Deaths, and Excess of Births over Deaths in each of the Registrars' Districts of Ireland, distinguishing the Sexes and Illegitimate Births throughout, ... 14–38

Page

Births registered in the Divisions and Superintendent Registrars' Districts, and in the Provinces and Counties (distinguishing Males and Females) in each of the Four Quarters of 1866, ... 40–49

Deaths registered in each of the Four Quarters of 1866 (distinguishing Males and Females), in Divisions and Superintendent Registrars' Districts, also in Provinces and Counties, 50–59

Deaths of Males and Females at different Ages registered in 1866, in Divisions and Superintendent Registrars' Districts, also in Provinces and Counties, . . . 60–67

Causes of Death of Males and Females in Ireland, at different periods of life, in 1866, . 68–75

Supplementary Table of Causes of Death of Males and Females, at different periods of life, in 1866, ... 76–79

Causes of Death of Males and Females in Ireland, and in each of the Divisions in 1866, . 80–87

Deaths from several Zymotic and other Causes in 1866, in the Divisions and Superintendent Registrars' Districts, and in the Provinces and Counties, . . . 88–91

APPENDIX.

Letter to the Registrar-General on the Causes of Death in Ireland in 1866, from William M. Burke, Esq., F.C.P.I., ... 95–98

Copy of Circular relating to Registration of Roman Catholic Marriages, . 98

Index of Superintendent Registrars' Districts, and of Registrars' Districts, 99–105

REPORT

TO

His Excellency JOHN POYNTZ, EARL SPENCER, K.G., &c., &c.,

Lord Lieutenant-General and General Governor of Ireland.

MAY IT PLEASE YOUR EXCELLENCY,—

As directed by the provisions of the 26 Vic., cap. 11, sec. 49, the 26 & 27 Vic., cap. 90, sec. 16, and the 7 & 8 Vic., cap. 81, sec. 56, I have the honour to transmit to your Excellency, in order that the same may be laid before Parliament, General Abstracts of the Births, Deaths, and Marriages registered in Ireland during the year 1866.

A General Abstract of the number of Births, Deaths, and Marriages, registered in the year 1866, was presented to Parliament in the Session of 1867. The Report now submitted contains detailed Tables of the ages and condition of persons married, of Births, distinguishing legitimate from illegitimate; and of Deaths, and their causes.

The Acts for the Registration of Births and Deaths, and Roman Catholic Marriages, came into operation on the 1st of January, 1864, but that for the Registration of Protestant Marriages of all denominations has been in force since the 1st of April, 1845.

For the purposes of Registration, the country has been divided into 163 Superintendent Registrars' Districts—co-extensive with the Poor Law Unions—and into 772 Registrars' Districts, which, with a few exceptions, are of equal extent with the Dispensary Districts formed under the Medical Charities Act.

GENERAL SUMMARY.

The *estimated* population of Ireland in the middle of 1866 was 5,582,625; the persons whose marriages were registered, amounted to 60,242; the number of marriages being 30,121; children born alive whose births were registered, amounted to 146,090; and the number of deaths registered was 93,027. The emigrants from Ireland during the year 1866 amounted to 99,467. In the previous year—1865—there were *registered* 30,802 marriages, 144,970 births, and 93,154 deaths; the number of emigrants was 101,497.

MARRIAGES.

30,121 marriages were registered during 1866, being in the proportion of ·540 marriages to every 100 persons, or of 1 marriage to every 185 persons, of the *estimated* population. The ratio in England was 1 in 113, or ·885 per cent., and in Scotland 1 in 133 or ·751 per cent. of the estimated population.

922 men and 4,613 women contracted marriage before they had attained their twenty-first year. The proportion of males married under age was 3·06; of females, 15·31 per cent. The proportions in England and Wales in 1866 were—males, 6·69, and females, 20·03 per cent. In Scotland the proportions were 7·20 males and 20·69 per cent. females.

Of widowers, 3,180, and of widows, 1,691 were re-married; the proportion being 10·56 per cent. of widowers, and 5·61 per cent. of widows,

to the total marriages. The like proportions in England and Wales were 13·91 widowers, and 9·40 per cent. widows. In Scotland the proportions were, widowers, 11·96, and widows, 5·60 per cent.

According to the provisions of the Registration Acts, every registry of a marriage is required to be signed by the parties married, two witnesses, and the officiating clergyman. A test of the elementary education of the persons contracting marriage is thus afforded by comparing the number who write their names in the registers, with the number who make a mark. Of 60,242 persons married in 1866, 26,596 (11,630 men and 14,966 women) signed the registers with marks; being in the proportion of 44·1 per cent.—38·6 per cent. of the males, and 49·7 per cent. of the females married.

The like rates in England and Wales for the same year were 21·6 per cent. of males, and 30·0 per cent. of females; and in Scotland 11·22 of males and 22·00 per cent. of females.

The marriage registers contain a column in which the age of each of the parties married is inserted; but as the law only requires it to be stated whether the parties are "of full age" or "minors," the precise age at marriage is not always entered in the registers. In 1866 the exact ages of both parties were given in 12,892 instances. Of these 11,619 were bachelors, and 12,265 spinsters; 1,273 were widowers, and 627 widows. The largest number of wives was married between 21 and 30—the number being 7,985, or more than one-half of the whole number whose ages are recorded. The largest number of husbands—7,914—is also found to have been married between 21 and 30 years of age.

298 bachelors were married to widows, both of whose ages at the time of marriage are recorded. Of these, 160 of the widows and 140 of the bachelors married between 25 and 35 years of age. Of 944 widowers who married spinsters, 430 of the latter were between 25 and 35 years of age; whilst the largest number of the widowers on their re-marriages ranged chiefly between 30 and 45.

Of widowers and widows married, whose ages at the time of marriage are stated, there were 329 couples. Of these the largest number of widows appears to have been between 40 and 50, and of widowers between 50 and 60. 12 widowers and 1 widow were married when they were above 70 years old.

With respect to Roman Catholic Marriages, the 26 & 27 Vic., cap. 90, directs that parties about to contract marriage shall produce to the clergyman celebrating the marriage a certificate, to be procured from the Registrar, filled up as far as possible by that officer with the particulars necessary to be registered, which certificate the parties married, the witnesses, and the officiating clergyman are required to sign. When so filled up the certificate is to be returned within three days to the Registrar by the husband, under a penalty of ten pounds.

With a view to facilitate the registration of marriages under the Act referred to, and at the special request of several dignitaries of the Roman Catholic Church,—with the approval of the Law Officers of the Crown—(who at that time were the Right Hon. Thomas O'Hagan, M.P., and James A. Lawson, esq., Q.C.)—I instructed the District Registrars to furnish to each parish priest, who should apply for them, forms of certificate to be duly filled, signed, and forwarded to the Registrar on the occasion of a marriage, thus saving the husband the inconvenience of procuring from the Registrar a form of certificate *previous* to his mar-

riage, as required by the Statute.* I also furnished all the Roman Catholic clergy in Ireland with copies of the Act above referred to, in order that the requirements of the law might be known to them previous to coming into operation.

The proportion per cent. of marriages to the estimated population, and of persons married who wrote their names in the registers; also of minors, widowers, and widows, are given in the following table, for the several registration divisions:—

TABLE I.—*The Proportional Number of Marriages in the Eight Divisions of Ireland during the years* 1864, 1865, *and* 1866, *of Persons who Signed their Names, of Persons not of Full Age, and of Re-marriages.*

Registration Divisions.			Marriages to 100 of the Estimated Population	Signed their Names in Writing.		Persons not of Full Age.		Re-marriages.

		1866	·592	58·2	45·7	2·99	18·07	10·06	6·64

The extent and position of each of these divisions are specified at page xxxv.

Of the total number of marriages registered (30,121) 21,211 were celebrated by Roman Catholic clergymen, and entered in the register books by the Registrars in accordance with the 26th and 27th Vic., cap. 90; and 8,910 marriages were of the various Protestant persuasions. Of the latter marriages 5,006 were in churches and chapels of the Established Church, 2,697 in Presbyterian Meeting-houses, 245 in "Registered Buildings," 946 in the Registrars' offices, 14 according to the usages of the Society of Friends, and 2 marriages were of members of the Jewish persuasion. Of the entire number of marriages in 1866 there were contracted in the quarter ending the last day of March, 11,992; of June, 6,081; of September, 5,566; of December, 6,482.

* For copy of Circular issued on this subject, see page 98.

The following table gives a statement showing in continuation of the return in my report for 1865, the number of marriages solemnized in Ireland under the Marriages Act of 1844, distinguishing the mode of celebration:—

TABLE II.—*The Number of Marriages registered under 7 & 8 Vic., c. 81, in each Year, from 1st April, 1845, to 31st December, 1866, and the Mode in which the Marriages were solemnized.*

Years ended 31st December	Marriages. According to the Rites of the Established Church.						Not according to the Rites of the Established Church.						Total Marriages.
	Special Licence.	Licence.	Banns.	Registrar's Certificate.	Not stated by which of the foregoing Forms.	Total.	In Registered Presbyterian Meeting-houses.	In Registered Buildings.	In the Registrars' Offices.	Society of Friends.	Jews.	Total.

There is not any return made to me of the places of worship belonging to Roman Catholics in which marriages are celebrated; but under the provisions of the 7th & 8th Vic., cap. 81, I am enabled to state respecting other religious persuasions, that there were 1,458 Churches and Chapels of the Established Church, 574 registered Presbyterian Meeting-houses, and 200 Registered Buildings belonging to various denominations, in which marriages might lawfully be solemnized, on the 31st December, 1866. During the year 1866 there was an increase of four in the number of such places in the Established Church; and of eight in other religious communities. The "Registered Buildings" belong to the following denominations:—

Denominations.	No. of Places of Worship.	Denominations.	No. of Places of Worship.
Wesleyan Methodists, . .	108	Methodists New Connexion, .	5
Reformed Presbyterians, . .	33	Church Methodists, . .	1
Independents, ...	20	Covenanters, ...	1
Baptists, ...	11	Evangelical Union, . . .	1
Seceders, ...	10		
United Presbyterians, . .	5	Total, . .	200
Moravians or United Brethren,	5		

* The 7 & 8 Vic., c. 81, came into operation 1st April, 1845.

The following Table shows by Divisions and Registrars' Districts the number of places of worship in which marriages (under the 7 & 8 Vic., cap. 81) may be solemnized in each District or Union, distinguishing the religious denominations:—

During the year 1866 there were issued by the Registrars, 744 Licences for Marriage in Registered Buildings, and in the Registrars' offices.

The number of Marriage Licences issued by the licensing Ministers of the several Presbyterian bodies is given in the following summary :—

Presbytery or Synod.	Number of Licensing Ministers on 31st December, 1866.	Number of Registered Meeting-houses on 31st December, 1866.	Number of Licences issued.
1. General Assembly of the Presbyterian Church in Ireland,	116	534	2,642
2. Remonstrant Synod of Ulster,	8	21	48
3. Presbytery of Antrim,	4	10	34
4. United Presbytery or Synod of Munster,	4	4	–
5. Northern Presbytery of Antrim,	1	5	11
Total,	133	574	2,735

BIRTHS.

The births registered in Ireland during 1866, amounted to 146,090. Of these, 75,095 were males, and 70,995 females, being in the proportion of 105·8 boys to every 100 girls. In England, in the same year, the number of males to 100 females whose births were registered was 104·3; and in Scotland 105·5.

The rate per cent. of births to the *estimated* population was 2·617. In England the rate was 3·554, and in Scotland 3·60.

There were 4,869 illegitimate births, of which 2,506 were those of males, and 2,363 females; the proportion to the total number of births being 3·3 in every 100. The rate in England was 6·0, and in Scotland 10·2 per cent. The highest rates, 5·7 and 4·6, of illegitimate children in every 100 born, occurred in the North-Eastern and South-Eastern Divisions respectively.

The following table shows the proportion of legitimate and illegitimate births *registered* in each of the eight Divisions in 1864, 1865, and 1866.

TABLE IV.—*The Per-centage of Legitimate and Illegitimate Births registered in Ireland during the years* 1864, 1865, *and* 1866, *by Divisions.*

Divisions.	Proportion per cent. of Legitimate Births.			Proportion per cent. of Illegitimate Births.		
	1864.	1865.	1866.	1864.	1865.	1866.
IRELAND,	96·2	96·3	96·7	3·8	3·7	3·3

South-Western,	97·6	97·5	97·7	2·4	2·5	2·3

40,002 births were registered during the quarter ended 31st March; 38,785 in that ended 30th June; 33,581 during that ended 30th September; and 33,722 in that ended 31st December.

DEATHS.

The deaths registered in 1866 amounted to 93,027, of which 46,140 were males, and 46,887 females, being in the proportion of 1·666 per cent. of

the *estimated* population, or in the ratio of 1 *registered* death to every 6[illegible] persons. The proportion in England for the same year was 2·361 pe[illegible] cent., or 1 in 42; and in Scotland 2·263 per cent., or 1 in 44.

The following table shows the per-centage of mortality at differen[illegible] ages:—

TABLE V.—*The Mortality per Cent. at each Age-period, according to the Registration of Deaths in Ireland, during the Years* 1864, 1865, *and* 1866, *by Sexes.*

Sexes.		Ages.

	1866	26·03	4·70	2·49	7·14	6·86	6·18	7·73	11·19	12·94	10·66	3·37	·71

Of the persons whose deaths were registered during the year 26·03 in every 100 were children under 5 years old—of whom 27·99 per cent. were males, and 24·11 per cent. females. 13·93 per cent. of the men, and 15·54 per cent. of the women, whose deaths were registered had passed their 75th year. 58 of the males and 83 of the females in every 10,000 were stated in the returns to have been over 95 years of age.

EMIGRATION.

During the year 1866 the number of emigrants who left the ports of Ireland amounted to 99,467; of these 59,561 were males and 39,906 females. Of the whole number 17,379, or 17·5 per cent., were from Leinster; 36,971, or 37·2 per cent., from Munster; 26,259, or 26·4 per cent. from Ulster; and 12,439, or 12·5 per cent., from Connaught: 6,419 persons, or 6·4 per cent., did not state the county or province to which they belonged.

Of the emigrants in 1866, 13·6 per cent. were under 15 years of age; 75·3 per cent. were 15 to 35 years old; 10·4 per cent. were 35 and upwards; and the ages of ·7 per cent. were not specified in the returns.

METEOROLOGY.

The following is an abstract of the meteorological observations taken during the year 1866, at the Ordnance Survey Office,* Phœnix Park, Dublin, kindly furnished by Captain Wilkinson, R.E.

The barometer was highest during the year, at 9.30 A.M., on 24th January, when it stood at 30·673 inches, the wind blowing from S.W.; it was lowest on 23rd March, at 9.30 P.M., with the wind from S.E., when it was 28·663 inches.

The highest temperature in the air was 80·7,° on 13th July, and the lowest was 17·5°, on the 1st March.

Rain or snow fell on 216 days; the greatest rain-fall in 24 hours was ·975 in., on 18th June, with wind blowing N.W.; the total amount registered was 26·857 inches.

* Latitude 53° 21′ 44·65″ north; longitude 6° 21′ 6·35″ west. Height above the sea 158·8 feet. From the 1st January, 1865, inclusive, the barometer has been corrected for altitude, as well as reduced to 32° Fahrenheit.

The prevailing wind was from the W., from which point it blew on 107 days; it was from S.W. on 84 days; on 26 days from N.W.; on 38 days from S.; on 30 days from E.; on 17 days from S.E.; on 17 days from N.; on 13 days from N.E., at 9.30 A.M.; on 33 days the air was calm at that hour. The total pressure of the W. wind was 302·62 lbs., being an average of 2·83 lbs. per square foot. The strongest wind blew from S.W., on the 6th December, when the pressure was 25 lbs. per square foot.

I beg here to repeat the observations made in my Report to your Excellency for 1864, with respect to the working of the Acts for the Registration of Births, Deaths, and Marriages in Ireland, as I regret to state that the numbers of these events registered in 1866 do not show any improvement compared with previous years:—

"In several instances prosecutions have been resorted to with some advantage; but notwithstanding the exertions made to induce a general compliance with the law throughout the country, numerous cases of neglect to register births and

deaths have been reported to me by the District Registrars, but frequently at too late a period after their occurrence to allow of the parties being proceeded against at the Petty Sessions.

"I regret to add that the registration of marriages under the 26th & 27th Vic., cap. 90, is not at all satisfactory in some Districts, owing to the Clergy who have celebrated the marriages having declined to sign the necessary certificates.

"The marriages solemnized under the provisions of the 7th & 8th Vic., cap. 81, which came into operation in 1845, are, I believe, all registered.

"The following are the ratios of Births, Deaths, and Marriages to population in different countries compared with the ratio in Ireland in 1864 [and in 1865 and 1866]:—

Countries.	Ratio to Population.		
	Births.	Deaths.	Marriages.
IRELAND [in 1864],	1 in 42	1 in 61	1 in 207
IRELAND [in 1865],	1 in 39	1 in 61	1 in 183
IRELAND [in 1866],	1 in 38	1 in 60	1 in 185
England,	1 „ 28	1 „ 42	1 „ 116
Scotland,	1 „ 28	1 „ 42	1 „ 137
Sweden,	1 „ 30	1 „ 50	1 „ 145
Prussia (Old Provinces),	1 „ 24	1 „ 38	1 „ 116
Hanover,	1 „ 30	1 „ 44	1 „ 124
Wurtemburg,	1 „ 23	1 „ 31	1 „ —
Hanse Towns: Bremen,	1 „ 28	1 „ 37	1 „ 105
Holland,	1 „ 30	1 „ 42	1 „ 127
France,	1 „ 38	1 „ 44	1 „ 127
Spain,	1 „ 26	1 „ 32	1 „ 127
Austria (exclusive of Hungary),	1 „ 25	1 „ 31	1 „ 121

"It will be seen from the foregoing figures, compiled from the Statistical Tables published by the Board of Trade, how incomplete was Registration in Ireland in 1864, and comparing the number of Births, Deaths, and Marriages recorded in that year with those since annually registered, I regret to state that there appears but little improvement in the subsequent years:—

Registered.	1864.	1865.	1866.	1867.	1868.
Births,	136,414	144,970	146,090	144,318	146,108
Deaths,	93,144	93,154	93,027	93,911	86,803
Marriages,	27,406	30,802	30,121	29,796	27,753"

Following this Report are summaries of the Quarterly Reports issued in 1866, and the Appendix contains a letter addressed to me by Dr. Burke, the Superintendent of Medical Statistics, respecting the causes of death—to which I beg to refer.

I have the honour to be
Your Excellency's
Very faithful servant,

William Donnelly,
Registrar-General.

General Register Office,
Dublin, 31st March, 1870.

SUMMARY OF THE QUARTERLY REPORTS, 1866.

Quarterly Reports. First Quarter.

First Quarter—January, February, March.

Marriages.—The number of marriages *registered* in Ireland during the first three months of the year 1866 amounted to 11,992, equal to an annual ratio of 1 in every 116, or ·859 per cent. of the *estimated* population. The number *registered* during the corresponding period of 1865 was 12,308.

Of the 11,992 marriages *registered* during the first quarter of 1866, 9,681 were between Roman Catholics, representing an annual ratio of 1 marriage in every 112, or ·893 per cent. of the Roman Catholic population; and the remaining 2,311 marriages were between Protestants, being equal to an annual ratio of 1 in every 134, or ·745 per cent. of the Protestant population.

Births.—The births *registered* during the quarter ending on 31st March, 1866, amounted to 40,002 (20,577 boys and 19,425 girls), being equal to an annual ratio of 1 in every 34·9, or 2·87 per cent. of the *estimated* population; the number of births registered during the corresponding quarter of 1865 was 38,320, and in the first quarter of 1864 the number was 30,179.

Deaths.—The number of deaths registered in Ireland during the quarter amounted to 27,614 (13,575 males and 14,039 females), representing an annual ratio of 1 in every 50·5, or 1·98 per cent. of the *estimated* population. The number *registered* in the corresponding quarter of 1865 was 29,259, and in 1864 it was 28,043.

Emigration.—According to the returns obtained by the Enumerators, the number of emigrants who left the ports of Ireland, during the quarter ended 31st March, 1866, amounted to 25,809—16,689 males and 9,120 females—being 9,961 more than the number who emigrated during the corresponding quarter of 1865.

The *average* number of emigrants from Ireland *during the first three months* of the years 1852 to 1865 was 21,745; the number for the first quarter of 1866 is, therefore, 4,064 in excess of the average.

As will be seen by the following statement, the number of emigrants who left the country during *the first quarter* of each year in which the Returns were obtained* varied to a very great extent; in the first quarter of 1852 the number was 45,434, in 1853 it was 36,912, in 1854 it was 31,620, in 1855 it fell to 19,572, and from that period in only one year (1857) reached 20,000, until the year 1863, when it rose from 11,495, in 1862, to 24,792; it further increased to 27,625, in 1864; it then fell to 15,848 *for the first quarter* of 1865, and, as has been already stated, amounted to 25,809 during the first quarter of 1866.

STATEMENT showing the number of Emigrants who left Ireland during *the first three months* of each of the years 1852 to 1866, inclusive, according to Returns received by the Registrar-General.

	No. of Emigrants.		No. of Emigrants.		No. of Emigrants.
First three months of 1852,	45,434	First three months of 1857,	20.025	First three months of 1862,	11,495
„ 1853,	36,912	„ 1858,	12,118	„ 1863,	24,792
„ 1854,	31,620	„ 1859,	14,367	„ 1864,	27,625
„ 1855,	19,572	„ 1860,	15,525	„ 1865,	15,848
„ 1856,	14,870	„ 1861,	14,235	„ 1866,	25,809

Estimated Decrease of the Population.—The number of births *registered* during the quarter ended 31st March, 1866, being 40,002; the deaths 27,614; and the number of emigrants 25,809 (according to the returns obtained by the enumerators at the several seaports);—a decrease of 13,421 would, therefore, appear to have taken place in the population during that period.

PRICES OF PROVISIONS, AND PAUPERISM.

The average price of Messrs. Manders and Co.'s 4 lb. loaf for the first quarter of the year 1866 was 6½*d.*, being one penny higher than the average price for the

* Returns of the Emigration from Ireland were first obtained by the Registrar-General in May, 1851.

Quarterly Reports.

First Quarter.

corresponding period of 1865. The price during the first three weeks of the first quarter of 1866 was 7*d.*; it was 6½*d.* during the remaining weeks. The price was 5½*d.* during the whole of the corresponding quarter of 1865.

The price of oatmeal at the Dublin Corn Exchange ranged from 15*s.* 6*d.* in the first week to 14*s.* 6*d.* per cwt. in the last week of the first quarter of 1866; the average price for the three months being 14*s.* 10*d.*, against 11*s.* 9*d.* for the corresponding quarter of 1865.

The quotations for potatoes at the Potato Market, Dublin, were somewhat lower for the first quarter of 1866 than for the corresponding period of 1865; the averages for the former being 2*s.* 6*d.* to 3*s.* 6*d.*, and for the latter 3*s.* 1*d.* to 3*s.* 7*d.* per cwt.

The average prices of beef at the Dublin Cattle Market were also lower during the first quarter of 1866, than during the first three months of 1865; the averages being 50*s.* 6*d.* to 63*s.* 6*d.* per cwt. for the former, and 54*s.* 6*d.* to 68*s.* for the latter.

The average number of persons in Ireland receiving indoor relief on Saturdays during the quarter was 57,123; the average for the corresponding quarter of the year 1865 was 62,418. The smallest number of persons (54,894) receiving indoor relief was on Saturday, in the first week of January; this was also the case in the corresponding quarter of 1865 and of 1864. The largest number receiving indoor relief during the first quarter of 1866 was in the first and second weeks of March. The number of persons (10,163) receiving outdoor relief was also smallest in the first week of the quarter; the weekly average for the quarter was 11,927, against 11,296 in the corresponding period of 1865.

Of the persons receiving indoor relief during the first quarter of the year 1866, an average number of 465 in each week were located in Asylums for the Blind and the Deaf and Dumb, and in Extern Hospitals; in the corresponding quarter of 1865 the average weekly number was 523.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the first quarter of the year 1866, was 29·521 inches (in the corresponding period of 1865, and of 1864 it was 29,651 inches, and 29·725 inches respectively); the highest reading (30·490 inches) was on the 24th January, at 9.30 A.M., wind S.W.; and the lowest (28·480 inches) on the 23rd March, at 9.30 P.M., wind S.E.

The mean temperature of the air during the quarter was 41.5° (during the corresponding period of 1865 it was 38·9°, and in 1864 it was 40·2°); the maximum registered by the thermometer (68·0°) was on the 30th March, and the minimum (17·5°) was on the 1st of the same month.

Rain or snow fell on 54 days during the quarter. The rain-fall measured 7·508 inches (it was 5·979 inches and 5·227 inches respectively during the corresponding quarters of 1865 and 1864). The greatest monthly rain-fall during the first quarter of 1866 was in March, when 3·309 inches were registered.

The wind blew on 47 days from S.W.; 13 days from N.W.; 7 days from W.; 6 days from S.E.; and 5 days from N.E., at 9.30 A.M.; on only one day during the three months did the wind blow from the East at that hour, and on only two days from the North. The air was calm on 4 days at 9.30 A.M.

HEALTH OF THE PEOPLE.

The deaths registered during the first quarter of 1866 were far below the number registered during the corresponding periods of the years 1864 and 1865.

Zymotic diseases, in general, proved less fatal than during the preceding periods; in some districts, however, especially those in which precautionary measures were neglected, fever, scarlatina, measles, &c., proved most destructive.

The Registrar of the Randalstown District, Superintendent Registrar's District of Antrim, says, "I have had 21 cases of fever, while there have been registered

ring the same period 7 deaths from it. The disease, I am sorry to say, has *Quarterly Reports.* en on the increase for the last month, owing chiefly to my not having com- ulsory power to send such cases to the workhouse fever hospital. I saw to-day First Quarter. fever cases in one cabin, and the head of the family refused to have them removed hospital. *I should mention that the Guardians have a spring cart and bed for the nveyance of fever patients to hospital.*"

It would be well that the good example set by the Antrim Board of Guardians as more generally followed, as there can be no doubt that the poison of fever and her zymotic diseases is disseminated in consequence of fever patients being ansmitted to hospital in cabs and other public conveyances.

In Belfast No. 4 District 49 deaths resulted from fever.

Scarlatina of a malignant character prevailed in the Keady District, Armagh nion; 5 healthy children in one family were cut off by this scourge. In the ellaghy District, Magherafelt Union, scarlatina and its sequelæ proved fatal in 21 stances. In Mullingar District 27 deaths resulted from scarlatina. "This great ortality" (observes the Registrar) "I attribute to the filthy and uncleansed state of he back streets in this town." In Ennistimon scarlatina was very prevalent, but mparatively mild; this disease was also rife in Wexford, Galway, Westport; and the 50 deaths registered in the Achill District (Newport Union) 21 were ascribed scarlatina. The disease, however, had disappeared from many districts where had been epidemic.

Measles and whooping cough were very prevalent.

In Coleraine there were nine deaths from small-pox; in Arklow (Rathdrum Union) out of 78 deaths registered during the quarter, no less than 35 were caused by small-pox! Deaths from this disease also occurred in the Districts of Cappaghduff Ballinrobe Union), Ballymoney, &c. *It is much to be regretted that the Registrars of those districts in which fatal cases of small-pox were registered, were unable to state whether those who fell victims to this disease had been previously vaccinated.*

Bronchitis and other pulmonary affections proved very fatal, especially to the aged and the very young. The Registrar of the Portadown District (Lurgan Union) records a case of "pure Asiatic" cholera which proved fatal in 15 hours. Two deaths "from cholera" were registered in the Newtownards District.

While some of the Registrars were enabled to report favourably of the sanitary state of their districts, the majority complained loudly of the want of all sanitary precautions, especially the Registrars of Portrush, Bellaghy (Magherafelt Union), Ardara (Glenties Union), Kilskeer (Kells Union), Mullingar, and Carrick-on-Suir.

Those who fail to adopt such precautionary measures as have been over and over again recommended with a view to the improvement of the public health may see, when it is too late, the dire results of their negligence.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS, REGISTERED IN EACH OF THE EIGHT DIVISIONS

Into which Ireland has been divided for Statistical purposes.

Marriages.—The marriage rate during the quarter ending 31st March, 1866, was highest in the "South-Western" and "Western" Divisions, and lowest in the "Eastern" Division. This was also the case in the first quarter of 1865.

The order of the EIGHT DIVISIONS *as regards the annual Rate represented by the number of Marriages registered during the* FIRST *quarter of the years* 1865 *and* 1866 *is shown in the following Statement:—*

Quarter ending 31st March, 1865.		Quarter ending 31st March, 1866.	
Divisions.	*Ratio to Population.*	*Divisions.*	*Ratio to Population.*
1. South-Western,	1 in 74	South-Western,	1 in 77
2. Western,	„ 84	Western,	„ 81
3. South-Eastern,	„ 100	South-Eastern,	„ 117
4. North Midland,	„ 130	North-Western,	„ 125
5. North-Western,	„ 138	North-Eastern,	„ 147
6. South Midland,	„ 139	North Midland,	„ 155
7. North-Eastern,	„ 158	South Midland,	„ 157
8. Eastern,	„ 170	Eastern,	„ 165

Quarterly Reports.

First Quarter.

Births.—The birth-rate, during the first quarter of the year 1866, in t "South-Western" Division, was 1 in 30; this was higher than the rate in any the other divisions. The "South-Western" Division had also the highest birt rate for the first quarter of 1865 and of 1864.

The "South-Midland" Division, which ranked *third* for the first quarter 1864, had the lowest birth-rate for the first quarter of 1865, as well as for t corresponding period of 1866.

The "North-Western" has improved its position as to birth-rate; it came eigh (or last) for the first quarter of 1864; and sixth for the corresponding quarter 1865 and 1866.

The "North-Eastern" Division, which was fourth for the first quarter of 18 occupied the second place for the corresponding period in 1865, and maintain its position for the first quarter of 1866.

The "Western" Division was seventh for the first quarter of 1864; fifth for t corresponding period of 1865; and third for the first quarter of 1866.

The numerical order of the EIGHT DIVISIONS *as regards the annual Rate represent by the number of Births registered during the* FIRST *quarter of* 1864, 1865, a 1866, *is shown in the following Statement:—*

Quarter ending 31st March,

1864.		1865.		1866.	
Divisions.	*Ratio.*	*Divisions.*	*Ratio.*	*Divisions.*	*Rat*
1. South-Western,	1 in 37	South-Western,	1 in 33	South-Western,	1 in
2. South-Eastern,	„ 42	North-Eastern,	„ 34	North-Eastern,	„
3. South Midland,	„ 47	South-Eastern,	„ 37	Western,	„
4. North-Eastern,	„ 47	Eastern,	„ 37	South-Eastern,	„
5. Eastern,	„ 48	Western,	„ 38	Eastern,	„
6. North Midland,	„ 52	North-Western,	„ 40	North-Western,	„
7. Western,	„ 55	North Midland,	„ 41	North Midland,	„
8. North-Western,	„ 56	South Midland,	„ 42	South Midland,	„

Deaths.—The rate of mortality was not so high in any of the divisions duri the first quarter of the year 1866, as it was during the corresponding period of 18

The "Eastern" Division had the highest rate of mortality (1 in 41) for t first quarter of 1866; it had also the highest rate (1 in 40) for the correspondi quarter of 1865; it ranked second for the first quarter of 1864, when its death-ra was 1 in 43. The North-Eastern Division came second, and the South-Easte third, as regards rate of mortality, for the first quarter of 1866. These thr divisions had the highest rates of mortality for the first quarter in each of t years 1864, 1865, and 1866.

The Western Division came last for each of the quarters just mentioned; t average rate of mortality therein for the first quarter of 1866 was 1 in 64; is, however, but right to state that many of the Unions or Superintendent Regi trars' Districts had a much higher rate than this, and that this low ratio for t division is produced by the extraordinarily low ratios afforded by the deat *registered* in some of the Unions.

The following Statement shows the EIGHT DIVISIONS *arranged according to t annual Rate of Mortality afforded by the number of Deaths registered during t* FIRST *quarter of* 1864, 1865, *and* 1866:—

Quarter ending 31st March,

1864.		1865.		1866.

Quarterly Reports.

First Quarter.

PROVINCES.

Marriages.—The number of marriages registered during the first quarter in the Province of Connaught affords an annual ratio of 1 in 84 of the population; in Munster the ratio was 1 in 87; in Ulster 1 in 148; and in Leinster 1 in 171.

The following Table shows, by PROVINCES, *the number of Marriages registered during the* FIRST *quarter of the years* 1864, 1865, *and* 1866, *together with the annual ratio to the estimated Population.*

REGISTRATION PROVINCES	MARRIAGES. Quarter ending 31st March,					
	1864.		1865.		1866.	
	Number.	Ratio.	Number.	Ratio.	Number.	Ratio.

Births.—The number of births registered in the Province of Munster during the first quarter of 1866 afforded the highest birth-rate, viz., 1 in 33; this province had also the highest birth-rate for the first quarter of 1865 and 1864; in Ulster and Connaught the birth-rate during the first quarter of 1866 was 1 in 34, and in Leinster it was only 1 in 39.

Deaths.—The rate of mortality during the quarter was highest in Leinster, viz., 1 in 44; in Ulster it was 1 in 50; in Munster, 1 in 53; and in Connaught, 1 in 63.

The following Table shows, by PROVINCES, *the number of Births and Deaths registered during the* FIRST *quarter of the years* 1864, 1865, *and* 1866, *together with the ratio to the estimated Population.*

REGISTRATION PROVINCES.	BIRTHS. Quarter ending 31st March,						DEATHS. Quarter ending 31st March,

Second Quarter.

Second Quarter.—April, May, June.

Marriages.—The number of marriages *registered* in Ireland during the second quarter of the year 1866 amounted to 6,081, equal to an annual ratio of 1 in every

Quarterly Reports.

Second Quarter.

230, or ·436 per cent. of the *estimated* population. The number *registered* in the corresponding period of 1865 was 5,659.

Of the 6,081 marriages *registered* during the second quarter of 1866, 3,970 were between Roman Catholics, representing an annual ratio of 1 marriage in 273, or ·366 per cent. of the Roman Catholic population; and the remaining 2,111 marriages were between Protestants, being equal to an annual ratio of 1 in every 147, or ·680 per cent. of the Protestant population.

Births.—There were 38,785 births *registered* in Ireland during the quarter ending 30th June, 1866—19,883 boys and 18,902 girls—representing an annual ratio of 1 in every 36·0, or 2·78 per cent. of the *estimated* population; the births *registered* during the corresponding quarter of 1865 were 39,109, and in 1864 they were 38,715.

Deaths.—The deaths *registered* in Ireland during the second quarter of 1866 amounted to 24,623—12,150 males and 12,473 females—affording an annual ratio of 1 in every 56·7, or 1·76 per cent. of the *estimated* population. The numbers *registered* during the corresponding quarters of 1864 and 1865 were 24,155 and 24,250 respectively.

Emigration.—According to the returns obtained by the Enumerators, the number of emigrants who left the ports of Ireland, during the quarter ended 30th June, 1866, amounted to 41,124—24,331 males and 16,793 females—being 3,536 more than the number who emigrated during the corresponding quarter of 1865.

Estimated Decrease of the Population.—The number of births *registered* during the quarter ended 30th June, 1866, being 38,785; the deaths 24,623; and the number of emigrants 41,124—(according to the returns obtained by the enumerators at the several seaports); a decrease of 26,962 would, therefore, appear to have taken place in the population of Ireland during that period.

PRICES OF PROVISIONS, AND PAUPERISM.

The price of Messrs. Manders and Co.'s 4 lb. loaf during the first twelve weeks of the second quarter of 1866 was 6½*d.*, being one halfpenny higher than the price through the entire of the corresponding quarter of 1865; it was raised to 7*d.* during the last week of the quarter.

The average price of oatmeal for the second quarter of 1866 was 15*s.* 8*d.* per cwt.; it rose from 14*s.* 6*d.* per cwt. in the first week of the quarter to 16*s.* 6*d.* in the last week; the average price for the corresponding quarter of 1865 was 14*s.* 1*d.*

The average prices of potatoes during the quarter at the Dublin Potato Market were 3*s.* 1*d.* to 3*s.* 11*d.* per cwt., differing very slightly from the averages for the corresponding quarter of 1865.

The prices of beef at the Dublin Cattle Market during the quarter ending 30th June last, ranged from 55*s.* to 80*s.* per cwt., the average for the quarter being 58*s.* to 72*s.* 6*d.*; the average prices for the corresponding quarter of 1865 were only 55*s.* to 67*s.* 6*d.* per cwt.

The average number of persons in Ireland receiving indoor relief on Saturday during the three months ending 30th June, 1866, was 51,404, against 54,852 for the corresponding period of 1865. On Saturday in the first week of the quarter the number was 54,810; on Saturday in the last week the number had decreased to 48,444.

The average weekly number of persons receiving outdoor relief during the quarter was 11,982, against 10,565 for the second quarter of 1865.

Of the persons receiving indoor relief during the second quarter of 1866 an average number of 466 in each week were located in Asylums for the Blind and the Deaf and Dumb, and in Extern Hospitals; in the corresponding quarter of 1865 the average weekly number was 475.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the second quarter of 1866 was 29·761 inches (in the corresponding quarter of 1865 and 1864 it was 29·916 inches, and 29·838 inches respectively); the highest reading (30·277 inches) was on the 23rd April, at 9.30 A.M., wind S.W.; and the lowest (29·252 inches) on the 18th June, at 3.30 P.M., wind N.W.

The mean temperature of the air during the quarter was 51·5° (in the corresponding quarter of 1865 it was 54·8°, and in the second quarter of 1864 it was 53·6°); the maximum temperature (79·8°) was on the 28th June, and the minimum (29·0°) was on the 4th April.

Rain or snow fell on 48 days during the quarter. The rain-fall measured 7·796 inches; in the corresponding quarters of 1865 and 1864 it was 5·816 inches and 4·083 inches respectively. The greatest monthly rain-fall was in June, when 3·652 inches were registered.

The wind blew on 27 days from S.W.; 14 days from N.E.; 12 days from E.; 11 days from N.W.; 9 days from W.; and 7 days from S.E., at 9.30 A.M.; on no day during the quarter did the wind blow from the south at that hour. The air was calm on 7 days at 9.30 A.M.

HEALTH OF THE PEOPLE.

The state of the public health during the quarter was generally satisfactory, though the number of deaths *registered* was in excess of the number *registered* during the corresponding period of 1865.

The low temperature, combined with the harsh easterly winds which prevailed during the months of April and May, rendered pulmonary affections among young and old extremely fatal, and to these causes must be referred the greater mortality during the quarter as compared with the corresponding periods of 1864 and 1865.

There was in most districts an absence of epidemic or zymotic diseases, and, save in some exceptional instances, the deaths from scarlatina, fever, measles, small-pox, &c., had notably diminished.

The Registrar of the Mohill District (Mohill Union), in referring to a malignant type of scarlatina in his locality, makes the following observations:—"It is a remarkable fact that all the fatal cases occurred under almost similar circumstances in *badly ventilated and filthy houses, where the poor sufferers had to breathe a foul and vitiated atmosphere;* in many instances the pigs and patients occupied the same apartments. In families of 9 or 10 attacked at the same time, *where attention was paid to cleanliness and ventilation, not one fatal case took place.*" The Registrar of the Mullingar District (Mullingar Union) says that of 22 deaths from scarlatina, which were *registered* during the quarter, "all occurred in the town, none in the country portions of the district, showing clearly *the evil of the filthy and uncleansed state of the back streets of this town.*" In many of the districts from which scarlatina had disappeared, the Registrars attributed the subsidence of the epidemic to improved sanitary arrangements.

It is satisfactory to find that no deaths from small-pox occurred in the Arklow District (Rathdrum Union) during the quarter, as in the quarter ended March 31st, the alarming number of 35 deaths from small-pox had been registered in that district. In the Ballymoney District a child aged 3 months (*not vaccinated*) died from small-pox. In Summerhill District (Trim Union) the Registrar notes that "two deaths from small-pox were registered in the past quarter, one in the person of an infant lately brought from Dublin, the second an adult, *neither of whom had been vaccinated.*"

Three deaths from small-pox occurred in the Boyle District; the Registrar

Quarterly Reports.

Second Quarter.

makes no reference to vaccination. With a view of demonstrating the pr tective powers of vaccination, the Registrar of Arthurstown Sub-district, Fetha (New Ross Union), relates the following interesting particulars:—"A sail returned from a foreign voyage to his native village, Ballyhack, and in a few da after was seized with small-pox in its confluent and most virulent form. T village swarms with a population steeped in poverty, and is in *every way* bad calculated to resist the extension of a contagious disease. The man's residence w in its centre, and segregation from its neighbours impossible. *Vaccination, ho ever, had been for years carefully attended to;* an infant residing in the house h been vaccinated only a few weeks before. The man recovered, and although tw months have gone by, there has not been another case of small-pox amongst t inhabitants."

Fever was generally of a milder type.

The number of Registrars who refer to the improved sanitary condition of the districts increases every quarter. It is to be hoped that the ample powers whi the new Sanitary Act affords for suppressing nuisances and protecting the pub against the spread of contagious diseases may soon be brought into action, so th the evils at present existing, and which have been so forcibly described by t Registrars, may be neutralized.

In the Scotstown District (Monaghan Union) 2 cases of English cholera we registered in the month of June, both having proved fatal within 48 hours; t other members of the same family were attacked, but recovered. In the Mal District (Inishowen Union) a case of English cholera proved fatal in 15 hours.

Some of the persons whose deaths were registered during the quarter had attain very advanced periods of life; thus in the Templemartin District (Bandon Unio "the death of a person aged 106 was registered;" in Aughnacloy District (Clogh Union) the death of a person aged 104 was registered; and the deaths centenarians were also registered in Shinrone (Roscrea Union) and Ballycastle.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS REGISTERED IN EACH OF THE EIGHT DIVISIONS.

Marriages.—The marriage-rate during the quarter ending 30th June, 1866, w highest in the "North-Eastern" and "Eastern" Divisions; the "South-Easte came next. The order in which these divisions ranged was the same in t corresponding quarter of 1865.

The order of the Eight Divisions *as regards the annual Rate represented by number of Marriages registered during the* Second *quarter of the years* 1865 *a* 1866 *is shown in the following Statement:—*

Quarter ending 30th June, 1865.		Quarter ending 30th June, 1866.	
Divisions.	*Ratio to Population.*	*Divisions.*	*Ratio to Populati*
1. North-Eastern,	1 in 171	North-Eastern,	1 in 164
2. Eastern,	„ 174	Eastern,	„ 164
3. South-Eastern,	„ 253	South-Eastern,	„ 261
4. South-Western,	„ 286	South-Western,	„ 261

6. South Midland,	„ 334	South Midland,	„ 309
7. North Midland,	„ 335	North Midland,	„ 312
8. Western,	„ 451	Western,	„ 337

Births.—The highest birth-rate attained in any of the divisions during second quarter of the years 1864, 1865, and 1866, was 1 in 31. This was the r

for the "North-Eastern" in 1865 and 1866. The "South Midland" ranked *sixth* as to birth-rate during the second quarter of 1864; it fell to *seventh* place in the corresponding quarter of 1865, and to *eighth* or last place for the second quarter of 1866, the ratios for this division being 1 in 40, 42, and 43 respectively, for the three periods named. *Quarterly Reports.* Second Quarter.

The numerical order of the Eight Divisions *as regards the annual Rate represented by the number of Births registered during the* Second *quarter of* 1864, 1865, *and* 1866, *is shown in the following Statement:—*

Quarter ending 30th June,

1864.		1865.		1866.	
Divisions.	*Ratio.*	*Divisions.*	*Ratio.*	*Divisions.*	*Ratio.*
1. South-Western,	1 in 32	North-Eastern,	1 in 31	North-Eastern,	1 in 31
2. North-Eastern,	„ 33	South-Western,	„ 32	South-Western,	„ 32
3. Eastern,	„ 35	Eastern,	„ 36	Eastern,	„ 35

7. Western,	„ 41	South Midland,	„ 42	North-Western,	„ 42
8. North-Western,	„ 43	Western,	„ 43	South Midland,	„ 43

Deaths.—The death rate in the "Eastern" Division during the quarter ending 30th June, 1866, was 1 in 45. This is the highest rate of mortality which has occurred during the second quarter of the year in any division since registration commenced in Ireland. The number of deaths *registered* in the "Western" Division during the quarter represents an annual ratio of only 1 in 76: in the corresponding quarter of 1864 and 1865, the rate afforded was 1 in 77 and 75 respectively.

The following statement shows the Eight Divisions *arranged according to the annual Rate of Mortality afforded by the number of Deaths registered during the* Second *quarter of* 1864, 1865, *and* 1866:—

Quarter ending 30th June,

1864.		1865.		1866.

Deaths.—The deaths *registered* in the Province of Leinster during the th months ending 30th June, 1866, afford an annual ratio of 1 in 49; in Ulste in 54; in Munster, 1 in 62; and in Connaught, 1 in 76.

Third Quarter.

Third Quarter.—July, August, September.

Marriages.—The number of marriages *registered* in Ireland during the th quarter of 1866 amounted to 5,566, equal to an annual ratio of 1 in every 2 or ·399 per cent. of the *estimated* population. The number *registered* in the responding period of 1865 was 5,854.

Of the 5,566 marriages *registered* during the third quarter of 1866, 3, were between Roman Catholics, representing an annual ratio of 1 marriage

every 309, or ·324 per cent. of the Roman Catholic population; and the remaining 2,057 marriages were between Protestants, being equal to an annual ratio of 1 in every 151, or ·663 per cent. of the Protestant population.

Births.—There were 33,581 births *registered* in Ireland during the quarter ending 30th September, 1866—17,327 boys and 16,254 girls—representing an annual ratio of 1 in every 41·6, or 2·41 per cent. of the *estimated* population; the births *registered* during the corresponding quarter of 1865 were 34,045, and in 1864 they were 33,877.

Deaths.—The deaths *registered* in Ireland during the third quarter of the year 1866 amounted to 18,600—9,383 males and 9,217 females—affording an annual ratio of 1 in every 75·0, or 1·33 per cent. of the *estimated* population. The numbers *registered* during the corresponding quarters of 1864 and 1865 were 19,191 and 18,632 respectively.

Emigration.—According to the returns obtained by the Enumerators, the number of emigrants who left the ports of Ireland, during the quarter ended 30th September, 1866, amounted to 19,640—11,447 males and 8,193 females—being 8,021 less than the number who emigrated during the corresponding quarter of 1865.

Estimated Decrease of the Population.—The number of births *registered* during the quarter ended 30th September, 1866, being 33,581; the deaths 18,600; and the number of emigrants 19,640 (according to the returns obtained by the enumerators at the several seaports); a decrease of 4,660 would, therefore, appear to have taken place in the population of Ireland during that period.

PRICES OF PROVISIONS, AND PAUPERISM.

The average price of Messrs. Manders and Co.'s 4lb. loaf for the third quarter of 1866 was 6½*d.* (being one halfpenny more than the average for the corresponding quarter of 1865); the price was 7*d.* during the first four weeks of the quarter, and 6½*d.* during the remaining nine weeks.

The average price of oatmeal for the third quarter of 1865 was 15*s.* 3*d.*; for the corresponding quarter of 1866 it was 15*s.* 5*d.*; the average price was highest (16*s.* 6*d.*) in the third week of the quarter, and lowest (14*s.* 6*d.*) in the eighth week; the average price in the last week was 15*s.*, against 14*s.* 3*d.* in the corresponding week of 1865.

The average prices of potatoes for the quarter, at the Dublin Potato Market, were 3*s.* 8*d.* to 5*s.* 2*d.*, being much higher than the average prices for the corresponding quarter of 1865, viz., 2*s.* 8*d.* to 4*s.*

The average price of inferior beef at the Dublin Cattle Market, during the third quarter of 1866, was 52*s.*, which was lower than the average price (56*s.* 6*d.*) for the corresponding quarter of 1865; best beef, however, was higher during the third quarter of 1866 than in the third quarter of 1865, the average price for the former being 69*s.* 6*d.*, and for the latter 67*s.* 6*d.*

The average number of persons in Ireland receiving indoor relief on Saturdays during the third quarter of 1866 was 44,980, against 46,632 for the corresponding period of 1865.

The average weekly number of persons receiving outdoor relief during the quarter was 10,870, against 9,093 for the third quarter of 1865.

Of the persons receiving indoor relief during the third quarter of 1866, an average number of 451 in each week were located in Asylums for the Blind and the Deaf and Dumb, and in Extern Hospitals; in the corresponding quarter of 1865 the average weekly number was 463.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix Park, Dublin, during the third quarter of the year 1866, was 29·628 inches (in the corresponding quarter of 1865 and 1864 it was 29·820 inches, and 29·804 inches

Quarterly Reports.

Third Quarter.

respectively); the highest reading (30·186 inches) was on the 10th July, at 9 P.M., when the air was calm; and the lowest (28·946 inches) on the 7th Aug at 9.30 A.M., wind S.W.

The mean temperature of the air during the quarter was 56·9° (it was 60·8° the corresponding quarter of 1865, and 57·8° in the third quarter of 1864); maximum temperature (80·7°) was on the 13th July, and the minimum (31·8°) on the 29th September.

Rain or snow fell on 56 days during the quarter. The rain-fall measu 6·656 inches; it was 6·318 inches in the third quarter of 1865, and 4·1 inches in the corresponding quarter of 1864. The total rain-fall during the half-y ended 30th September 1866, was 14·452 inches, against 12·134 inches and 8·2 inches during the corresponding period of 1865 and 1864, respectively. T greatest monthly rain-fall in the third quarter of 1866 was in September, when 2·9 inches were registered.

The prevailing winds during the quarter were westerly, the wind having be from W. on 27 days; from S.W. on 32 days; and from N.W. on 11 days, at 9. A.M. The air was calm on 6 days at that hour.

HEALTH OF THE PEOPLE.

Notwithstanding the outbreak of cholera in various parts of the country, t deaths *registered* during the third quarter of 1866 were 32 less than the numb *registered* during the corresponding quarter of 1865.

Fever, though prevalent in some districts, was generally of a mild type, a caused comparatively few deaths.

Deaths from scarlatina of a malignant nature were reported from various di tricts, especially Carrickfergus, Castlederg, Lurgan, Ballieborough, and Luca The Registrar of Ballinakill, Superintendent Registrar's District of Abbeylei reported 14 deaths from scarlatina; he made the following statement:—"I ha been for over thirty years the Medical Officer of Ballinakill Dispensary, but nev experienced so bad a type of scarlatina as the present epidemic afforded." Kilrush, 12 deaths from scarlatina were reported. In many districts this disea had disappeared, or very much decreased, especially in those localities whe attention had been paid to sanitary precautions.

About 30 Registrars reported cases of cholera having occurred in their districts in nearly every instance those who were first attacked by the disease had bee recently in localities where cholera abounded. Reapers and labourers arrivi from England were attacked in various parts of the country; and, generally speal ing, the disease was not confined to the individual first attacked, but spread to th other inmates of the house. In Mallow, where 26 deaths from cholera took pla during the quarter, the Registrar states that "the greater number of cases occurre in the locality of a well, the water of which was in daily use by the peop dwelling in its neighbourhood. This water has been since analyzed by Profess Cameron of Dublin. His opinion is that the water is not suitable for consumptio in consequence of its containing a very large amount of organic matter derive from animal sources. The people have been warned of the consequences of usin it. I may remark that this well is NOT the celebrated spa of Mallow, which spa in daily use by far the larger portion of the town."

The Registrar of the Carrick-on-Suir District, who had so frequently reporte on the unsatisfactory sanitary condition of his district, makes the following stat ment:—"The health of this district is at present most satisfactory. The sanitar condition of the town is now being improved, owing to the exertions of the Tow Commissioners since the 'Sanitary Act, 1866,' came into force." The Registra of Milltown Malbay, Superintendent Registrar's District of Ennistimon, testifies t the advantages of sanitary improvements; referring to the disappearance or sub sidence of fever and scarlatina in his district, he observes:—"More perfectl

rganized sanitary arrangements have confessedly brought about this disappearance f diseases, epidemic or endemic." *Quarterly Reports.* Third Quarter.

Whooping-cough was very prevalent and very fatal in the Cavan Union.

A death from hydrophobia took place in the Clady District, Londonderry Union; nd in the Boherboy District, Kanturk Union, a child 16 months old died from he same cause.

The ages of 3 women who died at Oranmore, Galway Union, were stated to have been 86, 90, and 102, respectively. In the Ballynacally District, Killadysert Union, the deaths of 6 persons, aged between 80 and 101, were reported. In Tobercurry, 5 deaths from old age were reported, including a sailor 106 years old, "who served under Lord Nelson at Trafalgar."

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS, REGISTERED IN EACH OF THE EIGHT DIVISIONS.

Marriages.—The number of marriages registered in the Eastern Division during the third quarter of 1866, afforded the highest annual ratio, viz.:—1 in 163 of the *estimated* population; in the North-Eastern Division the ratio was 1 in 173; in the North-Western Division the ratio was only 1 in 369; and in the Western Division 1 in 501.

The order of the Eight Divisions *as regards the annual Rate represented by the number of Marriages registered during the* Third *quarter of the years* 1865 *and* 1866, *is shown in the following statement:—*

Quarter ending 30th September, 1865.		Quarter ending 30th September, 1866.

Deaths.—The deaths registered in the Province of Leinster during the quarter ending the 30th September, 1866, represent an annual ratio of 1 in 61; in Ulster, 1 in 77; in Munster, 1 in 78; and in Connaught, 1 in 102.

Fourth Quarter.—October, November, December.

Fourth Quarter

Marriages.—There were 6,482 marriages *registered* in Ireland during the fourth quarter of 1866, affording an annual ratio of 1 in every 215, or ·464 per cent. of the *estimated* population. Of this number 4,051 were between Roman Catholics, representing a ratio of only 1 marriage in every 268, or ·374 per cent. of Roman Catholics, and 2,431 were between Protestants, affording a ratio of 1 in every 128, or ·783 per cent. of the Protestant population. The number of marriages *registered* in the corresponding quarter of 1865 was 6,981, and in the fourth quarter of 1864 the number was 6,269.

Births.—There were 33,722 births *registered* in Ireland during the quarter ending 31st December, 1866—17,308 boys and 16,414 girls—representing an annual ratio of 1 in every 41·4, or 2·42 per cent. of the *estimated* population;* the births *registered* during the corresponding quarter of 1865 were 33,496, and in 1864 they were 33,643.

Deaths.—The deaths *registered* in Ireland during the fourth quarter of the year 1866 amounted to 22,190—11,032 males and 11,158 females—affording an annual ratio of 1 in every 62·9, or 1·59 per cent. of the *estimated* population. The numbers *registered* during the corresponding quarters of 1864 and 1865 were 21,755 and 21,013 respectively.

Emigration.—According to the returns obtained by the Enumerators, the number of emigrants who left the ports of Ireland, during the quarter ended 31st December, 1866, amounted to 12,894—7,094 males and 5,800 females—being 7,506 less than the number who emigrated during the corresponding quarter of 1865.

Estimated Decrease of the Population.—The number of births *registered* during the quarter ended 31st December, 1866, being 33,722; the deaths 22,190; and the number of emigrants 12,894—(according to the returns obtained by the Enumerators at the several seaports);—a decrease of 1,362 would, therefore, appear to have taken place in the population of Ireland during that period.

Quarterly Reports.

Fourth Quarter.

PRICES OF PROVISIONS, AND PAUPERISM.

The average price of Messrs. Manders and Co.'s 4 lb. loaf for the fourth qua of 1866 was 7½*d.* (being one halfpenny more than the average for the corresp ing quarter of 1865); the price was 8*d.* during the last five weeks of the qua against 7*d.* during the corresponding weeks of the previous year.

The average price of oatmeal for the quarter ending 31st December, 1866, 15*s.* 11*d.* per cwt.; the average price for the corresponding quarter of 1865 15*s.* 1*d.* The average price was only 15*s.* in the first week, it was 17*s.* 3*d.* in ninth week, and 16*s.* 6*d.* in the last week of the quarter.

The average prices of potatoes per cwt., at the Dublin Potato Market, for fourth quarter of 1866, were 3*s.* 1*d.* to 4*s.* 11*d.*; for the corresponding quarte 1865 the prices ranged from 2*s.* 9*d.* to 3*s.* 8*d.*

Beef of inferior quality (at the Dublin Cattle Market), averaged a lower pric the last quarter of 1866, than for the corresponding quarter of 1865, the aver being respectively, 48*s.* 6*d.*, and 50*s.* 6*d.* per cwt.; whereas, best beef sol higher prices during the fourth quarter of 1866 than during the correspon period in 1865, the average price for the former three months being 67*s.*, and the latter 63*s.* 6*d.* per cwt.

The average number of persons in Ireland receiving indoor relief on Satur during the fourth quarter of 1866 was 48,534, against 49,457 for the correspon period of 1865.

The average weekly number of persons receiving outdoor relief during quarter was 11,217, against 8,859 for the fourth quarter of 1865.

Of the persons receiving indoor relief during the fourth quarter of 1866 average number of 443 in each week were located in Asylums for the Blind the Deaf and Dumb, and in Extern Hospitals; in the corresponding quarte 1865 the average weekly number was 460.

THE WEATHER.

The mean height of the barometer at the Ordnance Survey Office, Phœnix P Dublin, during the fourth quarter of 1866, was 29·773 inches (in the correspon quarter of 1865 and 1864 it was 29·674 inches, and 29·686 inches respective the highest reading (30·389 inches) was on the 8th October, at 9.30 A.M., w N.N.E.; and the lowest (29·092 inches) was on the 6th December, at 9.30 wind S.W.

The mean temperature of the air during the last quarter of 1866 was 4 (it was 46·5° in the fourth quarter of 1865, and 44·4° in the corresponding pe of 1864); the maximum temperature (65·9°) was on the 21st October, and minimum (21·8°) was on the 31st December.

Rain or snow fell on 58 days during the quarter. The rain-fall was unusu light, having only measured 4·897 inches, while it was 10·112 inches and 12 inches respectively in the corresponding quarters of 1865 and 1864. The gre monthly rain-fall in the last quarter of 1866 was in December, when 1·852 in were registered.

Though the rain-fall was so small, westerly winds were very prevalent during quarter, the wind having been from that point on 37 days; on 22 days from S. on 3 days from N.W.; on 7 days from S.E.; on 4 days from S.; on 2 days N.E.; and on one day from N., at 9·30 A.M. The air was calm on 16 days at hour.

HEALTH OF THE PEOPLE.

During the quarter ended December 31st, the deaths were 1,177 in exce those registered in the corresponding period of 1865. The increased mort

as mainly attributable to Asiatic cholera, which was, as testified by the Registrars, in most instances imported into their districts. In some localities this disease proved most fatal; thus in Bray, out of 98 deaths registered no less than 68 were ascribed to cholera, and 3 to diarrhœa; surely there must have been something very deficient in the sanitary arrangements of this town, to account for a mortality from cholera even greater than that in the east end of London. In Bray scarlatina had been heretofore a prevailing epidemic. In the Registrar's District of Arklow, Rathdrum Union, or Superintendent Registrar's District, where cholera had been directly imported by a sailor labouring under the disease, the Registrar enumerated 15 deaths from cholera out of 131 deaths, and he added that, "The sanitary state of Arklow is in a most unsatisfactory condition; the same state of overcrowding habitations, deficient sewerage, and want of pure water, as existed previous to the recent outbreak of cholera, and for the past thirteen years, the extent of the time of my residence here as Medical Officer to the Arklow Dispensary District."

In one part of the town of Carlow (Graigue), 77 deaths resulted from cholera: the Registrar makes no reference to the sanitary condition of that locality. In Limerick cholera proved very fatal. In many instances deaths from cholera were ascribed to other diseases; the lower classes, having a horror of speedy burials and the loss of "wakes," assigned the cause of death to anything save cholera.

The Registrar of Enniscorthy, No. 2, says, "Cholera and diarrhœa very prevalent at present in this district; a great desire amongst the poor to remain at home in preference to going to hospital, and if possible to *keep the disease secret.*"

In the Bantry Registrar's District, Bantry Union, a man arrived from Cork labouring under cholera, and died; he communicated the disease to 4 others, of whom 2 died. Four cases of cholera occurred at Glengarriff, 2 proving fatal; the Registrar states that "the contagion was distinctly traced from the city of Cork."

The following note from the Registrar of Tartaraghan, Superintendent Registrar's District of Lurgan, demands special attention; the more so, as the Poor Law Commissioners require that the medical officers of dispensaries in Ireland should be thoroughly qualified as midwifery practitioners. The Commissioners, also, in many cases, send through the country respectable women, educated at the Rotundo Lying-in Hospital, to attend upon the poor in their hour of need.

The Registrar referred to states that "Floodings are frequent, and uterine diseases prevail to a large extent, owing to the brutal manner in which females are treated by uneducated women attending as midwives, and the quantity of whiskey they consume during parturition. An accurate return of the number of deaths, or cause of death (especially infantile), is quite impossible, *a Medical and Registrar's certificate of the cause of death not being required before interment.*"

Fever and scarlatina were less fatal than usual, and wherever either prevailed, there defective sanitary arrangements existed, and by way of illustration, the report of the Registrar of the Cookstown District may be referred to; he states that, "In November and December we were visited by a severe epidemic of fever; 15 cases were entered in the Dispensary Relief Register alone; the majority of these patients resided in a block of houses, *filthy, wretchedly ventilated, and badly sewered, with manure heaps and a large cesspool in the rere.*" The Registrar states, that since his report to the Town Commissioners, matters are "in a fair sanitary condition." Again, in Skull District (Superintendent Registrar's District, Skull), the Registrar reports that "Four young women died of low continued fever (3 in one family), where pure air was inaccessible, and filth abounded internally and externally."

Every report testifies to the benefits resulting from the Compulsory Vaccination Act: only 10 deaths from small-pox were recorded in the fourth quarter. The Registrar of Castlefinn District (Strabane Union), makes the following satisfactory statement:—"There has not been a fatal case from small-pox recorded since the Registration Act came into force; the fact speaks for itself." Similar testimony is borne to the successful operation of the Act by the Registrar of Whitechurch District (Dungarvan Union), who says, "I have had but 2 cases of small-pox in

Quarterly Reports.

Fourth Quarter.

my district for the last three years, and they were of a mild type, which I attribu to the success attending the working of the Compulsory Vaccination Act."

Bronchitis and other chest affections proved very fatal to the aged, and thos tender years. Of the former many had long passed the three score and ten ye For instance, the reputed age of a man who died in Magherafelt was 102 years farmer died in Omagh District, whose age was stated to have been 120 years woman died in the Aughnacloy District (Clogher Union), at the age of 98, assigned cause of death being paralysis. The Registrar of the Finnea Dist (Granard Union), states that some deaths "were registered at an advanced a one beyond a century by several years;" and in the Cong District (Ballinr Union), one death was registered, the age stated being 104 years.

The publication of the Registrars' notes appears to have had a salutary eff for in their notes on this quarter some of the Registrars whose districts had be in a sanitary point of view, utterly neglected, advert to their improved conditi amongst these districts may be mentioned Newtownards (Newtownards Uni Swords (Balrothery Union), Milltown Malbay (Ennistimon Union), and Lough Though many Registrars still complain, it is satisfactory to perceive that s progress in the right direction has been achieved. It is needless to add, l desirable it would be to have in all localities, especially in those densely popula highly educated and efficient officers of health.

NUMBER OF MARRIAGES, BIRTHS, AND DEATHS REGISTERED I EACH OF THE EIGHT DIVISIONS.

Marriages.—The North-Eastern Division had the greatest number of marri *registered* in proportion to its population during the last quarter of the year 18 the annual ratio being 1 in 131. In the Eastern Division the ratio was 1 in 1 These two Divisions also ranked first and second respectively in the correspond quarters of 1864 and 1865. In the Western Division the ratio was only 1 in 4 The low ratio is to be accounted for by the large proportion of the Ro Catholic marriages being celebrated in the *first* quarter of the year.

The order of the Eight Divisions *as regards the annual Rate represented by number of Marriages registered during the* Fourth *quarter of the years* 1864, 1 *and* 1866, *is shown in the following Statement:—*

Quarter ending 31st December,					
1864.		1865.		1866.

Births.—The births (7,458) *registered* in Leinster during the fourth quarte 1866 afford an annual ratio of only 1 in 46 of the estimated population—in corresponding quarter of 1865 the ratio was 1 in 47, and in 1864, 1 in 45. Munster there were registered 8,729 births—a number equal to an annual rati 1 in 42 (the ratio for the fourth quarter of 1864 and 1865 respectively bein in 43); in Ulster the number was 11,711, or 1 in 40 which was also the ratio the corresponding quarters of 1864 and 1865; and in Connaught 5,824, or 1 37, against 1 in 39 for 1865, and 1 in 41 for 1864.

The following Table shows, by PROVINCES, *the number of Births and Dea registered during the quarters ending* 31*st December*, 1864, 1865, *and* 1866, *and ratio to the estimated Population :—*

Deaths.—There were 7,544 deaths registered in the province of Leinster dur the fourth quarter of 1866, the annual ratio afforded being 1 in 46—in the fou quarter of 1865 the ratio was 1 in 57, and in 1864 it was 1 in 58. In Mun there were registered 5,488 deaths, or 1 in 67 of the estimated population, aga 1 in 68 for the corresponding quarter of 1865, and 1 in 65 for the fourth qua of 1864; in Ulster, 6,759 or 1 in 69, against 1 in 67 in 1865, and 1 in 6 1864; and in Connaught, 2,399, or only 1 in 91, against 1 in 88 for the fou quarter of 1865, and 1 in 83 for 1864.

Topographical Description of the Eight Divisions into which Ireland has been divided in the foregoing Tables.

No. I. The North-Eastern Division.—This division may be described by a line passing southward from Lough Foyle through the counties of Londonderry, Tyrone, and Armagh, to Lough Bawn, in the county of Monaghan, and thence eastward to Carlingford Lough; the north and east being on the seaboard.

No. II. The North-Western Division is bounded on the east by the division just described, from Lough Foyle to a point a little south of Six Mile Cross, in the county of Tyrone, and may be described by a line drawn thence S.W. through the county of Fermanagh to the south of Enniskillen, embracing that portion of the north-west angle of the county of Cavan belonging to the Enniskillen Union, into the county of Leitrim, crossing Lough Allen, thence into the county of Sligo, to a point situated to the southward of the town of Ballymote, and thence extending north to Ballysadare Bay; the remainder of the division is bounded by the sea. It contains Loughs Erne and Derg, and part of Lough Allen, and large portions of it are mountainous.

No. III. The Eastern Division is situated in the provinces of Leinster and Ulster; it extends along the Irish Sea and St. George's Channel, from Warrenspoint, in the county of Down, to the south of Cahore Point, in the county of Wexford, stretching inland about twenty-five miles, and embracing the counties of Louth, Dublin, and Wicklow, and portions of the counties of Carlow, Cavan, Kildare, Meath, and Wexford; together with small portions of the counties of Armagh and Monaghan.

No. IV. The North Midland Division is situated in the provinces of Leinster, Ulster, and Connaught, and extends southward from its junction with the "North-Western" division near Six Mile Cross, in the county of Tyrone, to Tyrrellspass, in the county of Westmeath. Virginia, in the county of Cavan, is situated on its eastern border, and Tulsk, in the county of Roscommon, on its western.

No. V. The South Midland Division, situated in the provinces of Leinster and Munster, extends from the Hill of Down, in the county of Meath, southward to Borris, in the county of Carlow. Its southern boundary may be described by a line drawn thence to New Birmingham, in the county of Tipperary, and from that point south to Fethard, in the same county, thence westward to the northern base of the Galty Mountains, and in a north-westerly direction, to Pallasgreen, in the county of Limerick. On the east it is bounded by the "Eastern" division, and on the west by the "Western" and the "South-Western" divisions.

No. VI. The Western Division.—This division extends southwards from Sligo and Killala Bays to the northern bank of the River Shannon, lying westward of Limerick; the extreme points, north and south, being Benwee Head, in the county of Mayo, and Loop Head, in the county of Clare, a distance in or about 120 miles, which, however, does not represent the extent of seaboard, the western coast being indented by numerous bays and inlets. This division has been extended much more inland than the eastern division, as from its exposure to the Atlantic Ocean, and the prevalence of westerly winds (which blow for nearly three-fourths of the year), the climate must be affected for a considerable distance inland; the Unions situated on the extreme east are Boyle, Castlereagh, Glennamaddy, Mountbellew, Ballinasloe, and Portumna.

No. VII. The South-Eastern Division.—This division extends from its junction with the "Eastern" division southward of Cahore Point, in the county of Wexford, along the eastern and southern coasts to the east of Cork Harbour, and is bounded on the north by the South Midland division. It embraces the county of Waterford; nearly the whole of the county of Wexford; parts of the counties of Carlow, Kilkenny, and Tipperary; that portion of the county of Limerick (38,550 acres) comprised in the Mitchelstown Union, and a portion of the eastern side of Cork County.

No. VIII. The South-Western Division extends along the southern and western coasts from Cork Harbour to the river Shannon, and embraces the county of Kerry, nearly the whole of the counties of Cork and Limerick, and a small portion of the county of Clare, comprised in the Limerick Union.

POPULATION OF IRELAND (including Army, Navy, and Merchant Seamen on shore and in port) *estimated* to the middle of each of the Years 1801 to 1866 :—

NOTE.—This table has been constructed for the years 1801 to 1831—By adopting the rates of increase of the m and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first comp Census of Ireland having been taken in 1821.

1832 to 1841—By adopting the rate of increase between the population of 1831 and 1841, according to the I Census Report of 1841.

1842 to 1846—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting annual emigration from Ireland according to the returns received from the Emigration Commissioners in Englar

1847 to 1851—The English birth-rate, as above, was used, deducting the number of deaths and the numbe emigrants in each year, as given in the Irish Census Reports of 1851; the difference between the number arrived a this computation and the *actual* number by the Census of 1851 was divided over the intervening years in propor to the number of recorded deaths and the number of emigrants.

1852 to 1861—The English birth and death rates, as above, were used, deducting the number of emigrants accorc to the returns obtained by the Registrar-General for Ireland, and apportioning the difference as explained for last period.

1862 to 1866—The English birth and death rates, as above, were employed in the calculations for each y deducting the number of emigrants according to the returns received by the Registrar-General for Ireland.

* The *Registration Counties* consist of groups of Superintendent Registrars' Districts or Poor Law Unions. Whenever a District or Union extends into more than one County, it is assigned wholly to that County in which the greater portion of the population is located; hence all the *Registration* Counties differ more or less from the Counties *Proper*.

* For remainder of Belfast see next page.

NOTE.—The Registrars' Districts are sub-divisions of the Unions or Superintendent Registrars' Districts, and are identical with the Dispensary Districts of the same names, except in a few instances.

The letter *W* denotes that the Registrar's District contains within its limits the Workhouse belonging to the Union or Superintendent Registrar's District.

Wherever the minus sign (—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births in the Registrar's District, instead of exceeding the deaths, were, in fact, *less than the deaths*, to the extent stated.

Letter to the Registrar-General on the Causes of Death in Ireland, from William M. Burke, F.C.P.I.

Year 1866.

Sir,

I have the honour of submitting to you a few observations on the assigned causes of the deaths *registered* in Ireland during the year 1866.

It is noteworthy that, notwithstanding an epidemic visitation of cholera, the mortality during the year was somewhat less than in the year preceding.

I. Zymotic Diseases.

The number of deaths caused by Zymotic diseases amounted to 19,626—9,855 males, 9,771 females—showing a decrease of 176 as compared with the preceding year. Of the total deaths recorded, 1 in every 4·7 resulted from diseases of this class.

Fever caused 4,218—2,184 males and 2,034 females—or 1 in every 22·1 of the total deaths. The mortality from fever during the preceding year exceeded that of the year 1866 by 1,065.

Scarlet fever killed 3,501 persons—1,876 males and 1,625 females—of these, 2,003 were under 5 years of age, and 1,061 were aged between 5 and 10 years.

Of the deaths from all causes, 1 in every 26·6 resulted from scarlet fever.

The deaths consequent on the epidemic of Asiatic cholera amounted to 2,501—1,167 males, and 1,334 females,—or 1 in 37·2 of the total deaths.

The number of deaths from diarrhœa amounted to 1,911—973 males and 938 females—or 1 in 48·7 of the total deaths. Of the persons who died from diarrhœa 816 were under 5 years of age, and 691 were 55 years and upwards.

Whooping cough was the cause of 1,736 deaths—768 males and 968 females,—or 1 in every 53·6 of all the deaths. Nearly all the deaths from whooping cough occurred in children under 5 years of age: 2 females whose deaths were referred to whooping cough were stated to be aged between 25 and 35 years, and a man and a woman between 35 and 45 years.

Croup was the cause of 1,390 deaths—718 males, and 672 females. This disease appears to have been more prevalent in Ireland than in either England or Scotland in the year 1866, the ratios to the total number of deaths registered being in Ireland 1 in 67; in Scotland 1 in 79; and in England only 1 in 97.

851 deaths were referred to measles—464 males, and 387 females. The number registered in 1865 was 1,036, and in 1864, 630.

Diphtheria was the cause of 317 deaths, against 480 in 1865, and 661 in 1864. Of the deaths registered from diphtheria 111 occurred in the North-Eastern Division, and 88 in the Eastern Division.

The deaths from small-pox only amounted to 194, showing a decrease of 267 as compared with the year 1865, and being 660 less than in 1864.

Three males and 1 female died from hydrophobia.

The deaths of 2 men were caused by glanders; in the preceding year 9 men died from this disease; and in the year 1864, 3 men and 1 woman died from the same cause.

II. Constitutional Diseases.

The number of deaths from diseases termed constitutional amounted to 17,462—8,290 males and 9,172 females—affording a ratio of 1 in every 5·3 of the total deaths registered.

Phthisis, or pulmonary consumption, proved fatal in 10,119 instances—4,835 males and 5,284 females—being in the proportion of 1 death in every 9·2 of all the deaths.

1,762 deaths—723 males, and 1,039 females—were returned under the head of dropsy.

Cancer killed 1,694 persons—703 males, and 991 females.

1,466 deaths were referred to tabes mesenterica.

Hydrocephalus, or water on the brain, was the cause of 1,060 deaths—598 males and 462 females.

1,090 deaths were ascribed to scrofula.

III. Local Diseases.

The deaths attributed to local diseases numbered 31,380, or 1 in every 3 of all the deaths, the sexes being 16,774 males and 14,606 females.

To diseases of the nervous system 8,795 deaths were referred, the sexes being 4,840 males, and 3,955 females. Of these, 4,057 (2,270 males and 1,787 females) were returned as caused by convulsions; apoplexy caused 972 (563 males and 409 females); paralysis caused 1,756 (906 males and 850 females); cephalitis, or inflammation of the brain, &c., contributed 610 (342 males, 268 females). 805 deaths were tabulated under the head of brain disease unspecified; in 1865 the number so tabulated was 799, and in 1864 it was 1,182.

Diseases of the circulatory organs caused 3,168 deaths—1,696 males and 1,472 females; of these, 66 deaths (39 males and 27 females,) resulted from pericarditis; 100 were caused by aneurism (81 males and 19 females); 3,002 deaths (1,576 males and 1,426 females,) were returned under the head of heart disease unspecified.

Diseases of the respiratory organs, not including phthisis, caused 12,851 deaths—6,533 males and 6,318 females. Bronchitis was the cause of 8,959 deaths (4,366 males and 4,593 females); inflammation of the lungs proved fatal in 1,892 instances (1,145 males and 747 females); asthma was the assigned cause of 657 deaths; pleurisy of 402; and laryngitis of 112; to lung disease unspecified 829 deaths were referred.

Diseases of the digestive organs caused 4,894 deaths—2,637 males, 2,257 females. Of this number, inflammation of the bowels caused 662 deaths (368 males, and 294 females); 268 persons died from peritonitis (142 males, and 126 females); gastritis, or inflammation of the stomach, is stated to have caused 198 deaths;

ileus, which includes obstruction of the bowels, constipation, &c., caused 403 deaths (249 males and 154 females); 1,259 deaths were ascribed to stomach disease unspecified. To inflammation of the liver 243 deaths were referred; to jaundice 194; and to liver disease unspecified 1,005.

Diseases of the urinary organs proved fatal in 1,096 instances—844 males and 252 females. Of this number, inflammation of the kidneys caused 50 deaths; nephria, or Bright's disease, 198; stone in the bladder 23; inflammation of the bladder 52; diabetes 124; and kidney disease unspecified 564.

170 persons died from diseases of the generative organs.

Diseases of the organs of locomotion caused 172 deaths—103 males and 69 females.

234 deaths were ascribed to diseases of the integumentary system, viz., 9 to phlegmon; 82 to ulcer; and 143 to skin disease, &c.

IV. Developmental Diseases.

Diseases incidental to development contributed 18,442 deaths—7,782 males, 10,660 females—the proportion being 1 in 5 of the total deaths registered; 255 died from premature birth; cyanosis caused 13 deaths, of these, 11 were under 1 year old, 1 was 2 years old, and the other between 10 and 15 years. Spina bifida was the cause of 12 deaths; 26 deaths were tabulated under the head of "other malformations;" and teething was the cause assigned for 299 deaths.

667 women died in childbirth; as 328 women died from metria, or puerperal fever, so the total deaths resulting from child-bearing will amount to 995. For every 147 children born, the life of 1 mother was sacrificed.

The cause of 13,282 deaths was stated to have been old age; the sexes were, 5,525 males, and 7,757 females.

3,878 deaths were referred to atrophy and debility.

V. Violent Deaths.

The deaths from violence registered during the year amounted to 2,162—1,423 males and 739 females, or 1 in every 43 of the total deaths registered. In every 10,000 of the estimated population in 1866, 4 persons died from violence.

Of the deaths from violence, 1,889 were accidental, viz., 682 from fractures and contusions; 23 from gunshot wounds; 30 from cuts or stabs; 505 from burns or scalds—218 males and 287 females; 29 from poisoning; 464 from drowning—361 males, and 103 females; 72 from suffocation. In each of the two preceding years the number of deaths from suffocation was 71. Of the 72 persons whose deaths were caused by suffocation, 30 were under 12 months old. The nature of the accident was not stated in 84 instances, against 140 in the year 1865.

The number of deaths from homicide amounted to 140—80 males, and 60 females.

67 persons—45 males and 22 females—committed suicide, or 12 out of 1,000,000 of the estimated population were self-destroyed.

The modes resorted to for self-destruction were—gunshot wounds, 1 man; cuts or stabs, 1 man and 1 woman; poisoning, 2 men and 1 woman; drowning, 15 men and 12 women; hanging, 18 men and 4 women; and in the cases of 8 men and 4 women the mode of self-destruction was not stated in the returns.

Two men, between 20 and 25 years of age, were executed.

Sixty-four of the violent deaths were not classed.

In 504 cases of sudden death, the cause was not ascertained.

The cause of death was unspecified or ill-defined in 3,451 instances, or 1 in 27 of the total deaths. This evidences an improvement in the returns on the years 1864 and 1865, when the number of deaths unspecified were 6,504, or 1 in 14·3, and 4,853, or 1 in 19·2 respectively.

I have the honour to be,
Sir,
Your obedient servant,
W. M. BURKE.

To
The Registrar-General.

COPY of CIRCULAR relating to REGISTRATION of MARRIAGES celebrated by the ROMAN CATHOLIC CLERGY, 26 and 27 Vic., cap. 90.

General Register Office, Dublin,
31*st December*, 1863.

SIR,

I request you will furnish each Parish Priest within your District—who may apply to you for the same—with *six blank* Forms of Certificates of Marriage, which you will carefully take from the Certificate Book forwarded to you, and also with *six* of the printed Envelopes, addressed to "The Registrar of Births, Deaths, and Marriages."

By this course—which has been strongly recommended to me by many Dignitaries of the Roman Catholic Church, and approved of by the Law Officers of the Crown—the convenience of the Catholic Population, especially those of the poorer classes, will be greatly promoted in regard to the Registration of their Marriages.

A *further supply* of Certificates *will be forwarded on your application*—from which *blank Forms* will be furnished by you, from time to time, to those Parish Priests within your District who may require them. You will request each Rev. Gentleman obtaining the Certificates to give you a receipt for them, (on the accompanying Forms), in order that you may be able to account to me for all the Certificates entrusted to your care; and you will furnish me, at the end of each month, with the Names and Addresses of those Clergymen to whom you supply them. You will observe they are on *Water-marked* paper, with the words "Certificate of Marriage" printed thereon.

I beg to say that I feel assured you will discharge the duties of your office with zeal, discretion, and courtesy, and thus largely contribute to the success of the very Important Measures, in the carrying out of which you have so readily undertaken to assist by accepting the office of Registrar.

I am, Sir,
Your obedient Servant,
WILLIAM DONNELLY,
Registrar-General.

To
The Registrar of
Births, Deaths, and Marriages.

INDEX OF SUPERINTENDENT REGISTRARS' DISTRICTS.

* Thus, the number of Marriages in the Abbeyleix Superintendent Registrar's District may at once be ascertained by referring in the "*Abstract of Marriages*" to the Superintendent Registrar's District, numbered 75 (*see* page 4), and in like manner the number of Births and Deaths, of Deaths at different ages, &c., will be found by referring to the same Superintendent Registrar's District Number in the appropriate Tables.

INDEX OF REGISTRARS' DISTRICTS.

[The Number against each Registrar's District in the Third Column refers to the order in which it appears in the Arrangement of the Districts in the Tables of Abstracts; thus Abbey (120 : 4) is the 4th Registrar's District of the Tuam Superintendent Registrar's District, No. 120.]
